ERL 9-cell #3 & #4 cavity

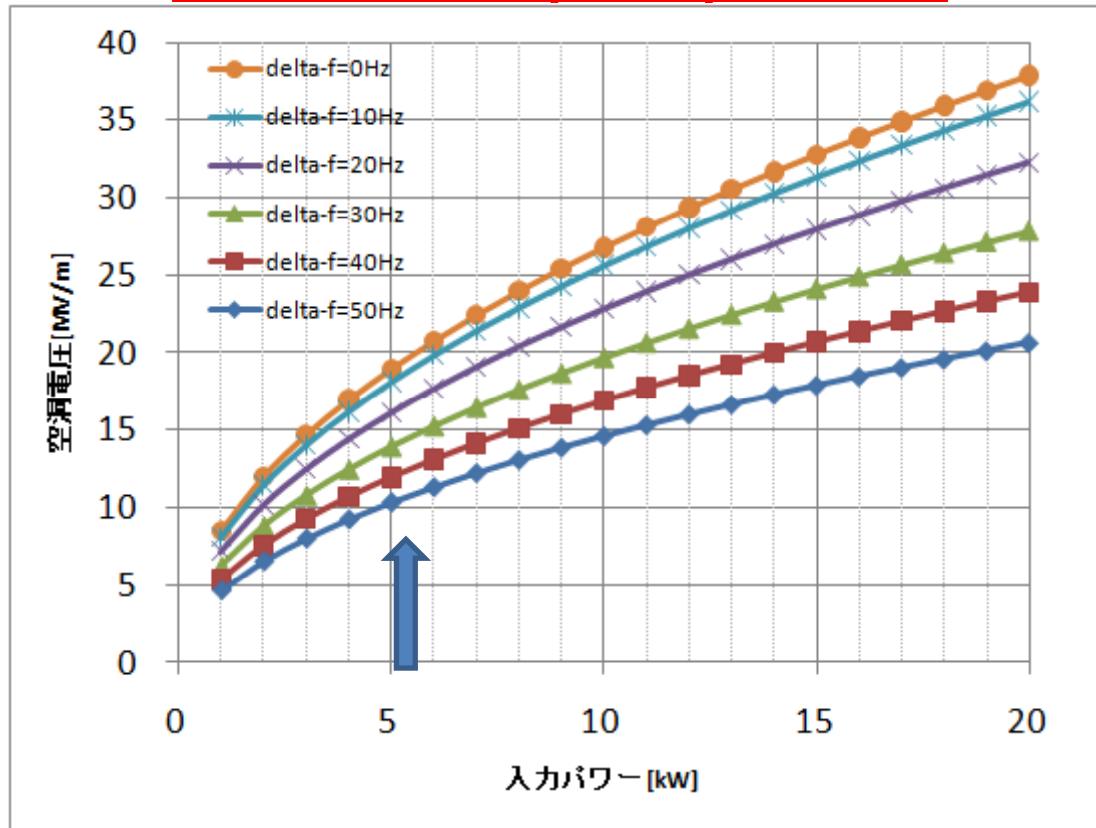

- #3 & #4 cavity will be installed into cERL cryomodule and applied for beam operation.
- Procedure of high pressure gas regulation has been applied.
- Now, under surface treatment and vertical testing

Specification for cERL main linac cavity

- Eacc
 - Required Eacc is 30 MV for two cavities
 - But, operated with vector sum mode at first stage
 - Assuming 2×10^7 coupling and maximum detuning of 50 Hz
 - Required maximum Eacc is $\sim 20\text{MV/m}$ for a cavity
- Q_0 value
 - Larger Q_0 value is desirable for He refrigerator
 - Target is 1×10^{10} at 15 MV/m
- Frequency
 - Frequency must be within mechanical tuner range (3mm = 900 kHz) at 2K, i.e. 1299.1~1300.0MHz
 - With good field flatness of > 98%

Eacc vs Input power

Assuming one cavity has $\Delta f=0\text{Hz}$ and another has $\Delta f=50\text{Hz}$.
In order to accelerate the beam with 30MV.

$$19.5\text{MV}(\Delta f=0\text{Hz}) + 10.6\text{MV/m}(\Delta f=50\text{Hz}) \quad (@5.3\text{kW} + 5.3 \text{kW})$$

20MV/m should be cleared, for vector sum operate of 15MV/m + 15MV/m

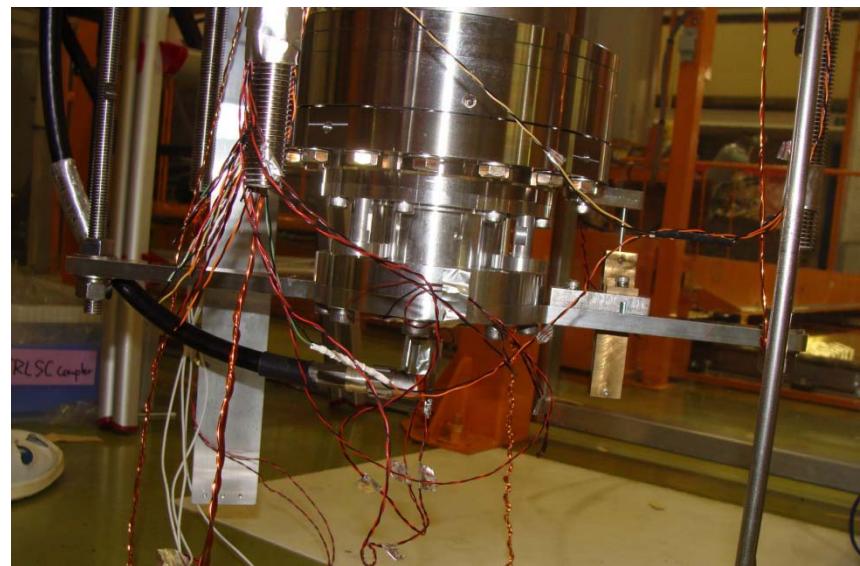

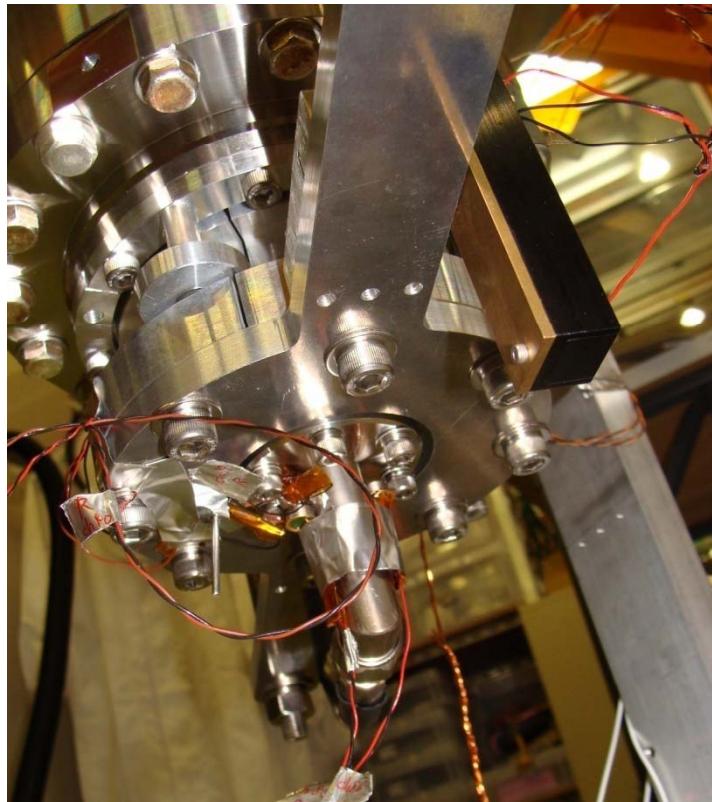

History for ERL 9-cell #3/#4 cavities (for cERL)

	#3 cavity (1st)	#3 cavity (2nd)	#4 cavity
Pre-EP and EP-1	5 um + 120 um		5 um + 120 um
Annealing	750 degree x 4hours		750 degree x 4hours
Pre-tuning	> 98% flatness	> 99 % flatness	> 98% flatness
EP-2	50 um	20 um	50 um
HPR	5hours + 5hours	7.5 hours + 5 hours	6hours + 5.5 hours
Assembly			
Baking	> 110 degree, 48 hours	> 110 degree, 48 hours	> 110 degree, 48 hours
Vertical test	(Done)	(Done)	(Done)

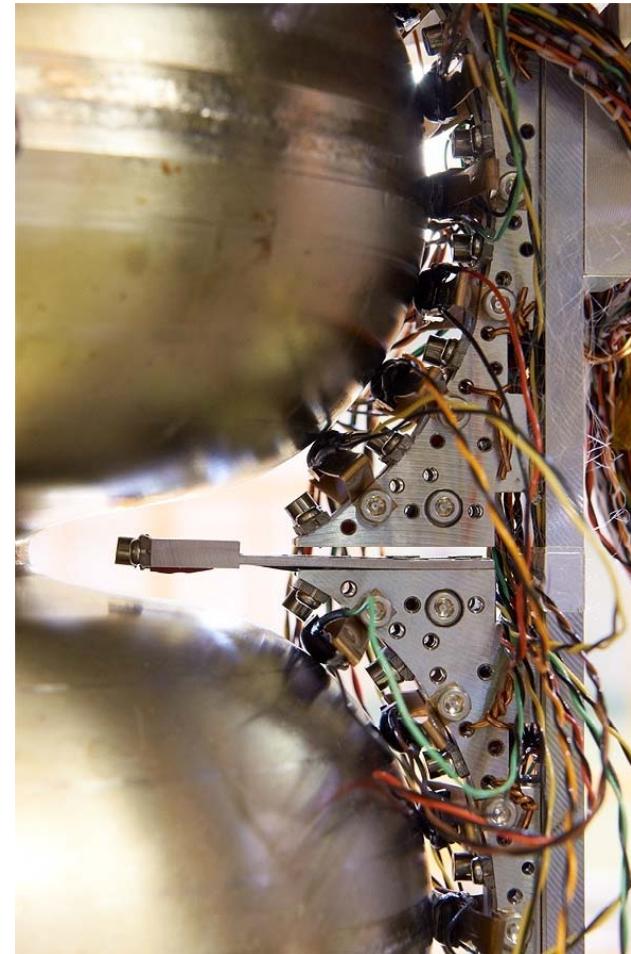

Vertical test setup

Variable input coupler was moved to bottom side, to avoid dust contamination from bellows

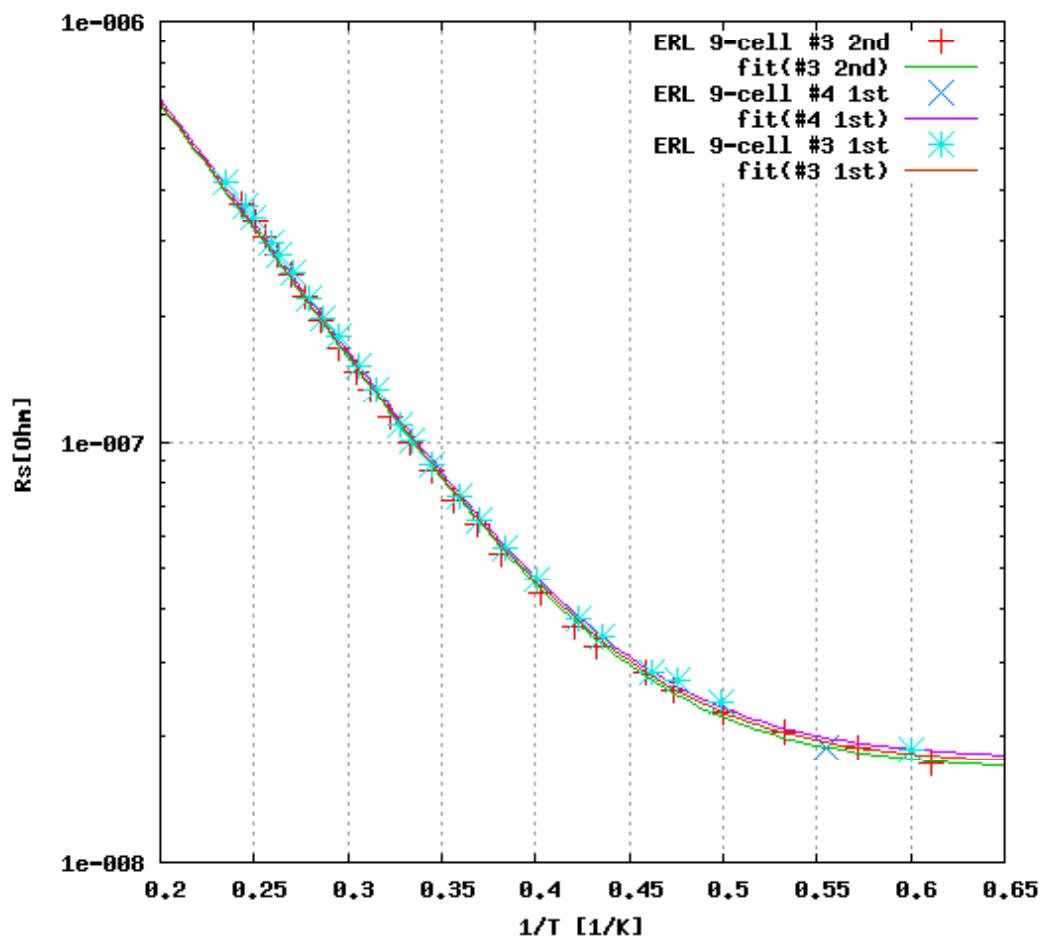

Cavity diagnostics

- Array of **Si diode** for X-ray detection and **carbon resistor** for temperature measurement
- They will rotate around cavity by using pulse motor

Q-T curve for ERL 9-cell #3, #4 cavities

#3 cavity (1st VT)

1299.647 MHz(@2K)

17.5 nΩ

#3 cavity (2nd VT)

1299.603 MHz(@2K)

16.6 nΩ

#4 cavity

1299.717 MHz(@2K)

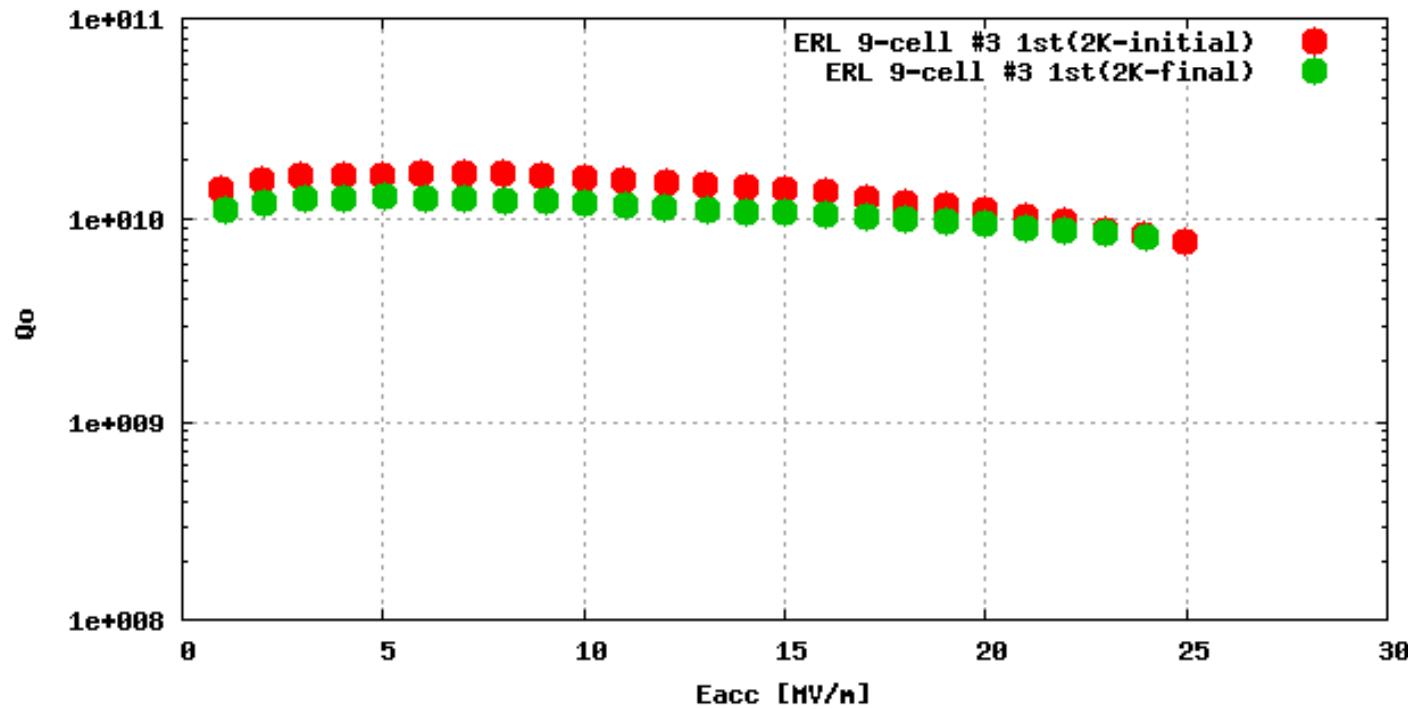

17.0 nΩ

Residual resistance
Includes loss at SUS
flanges

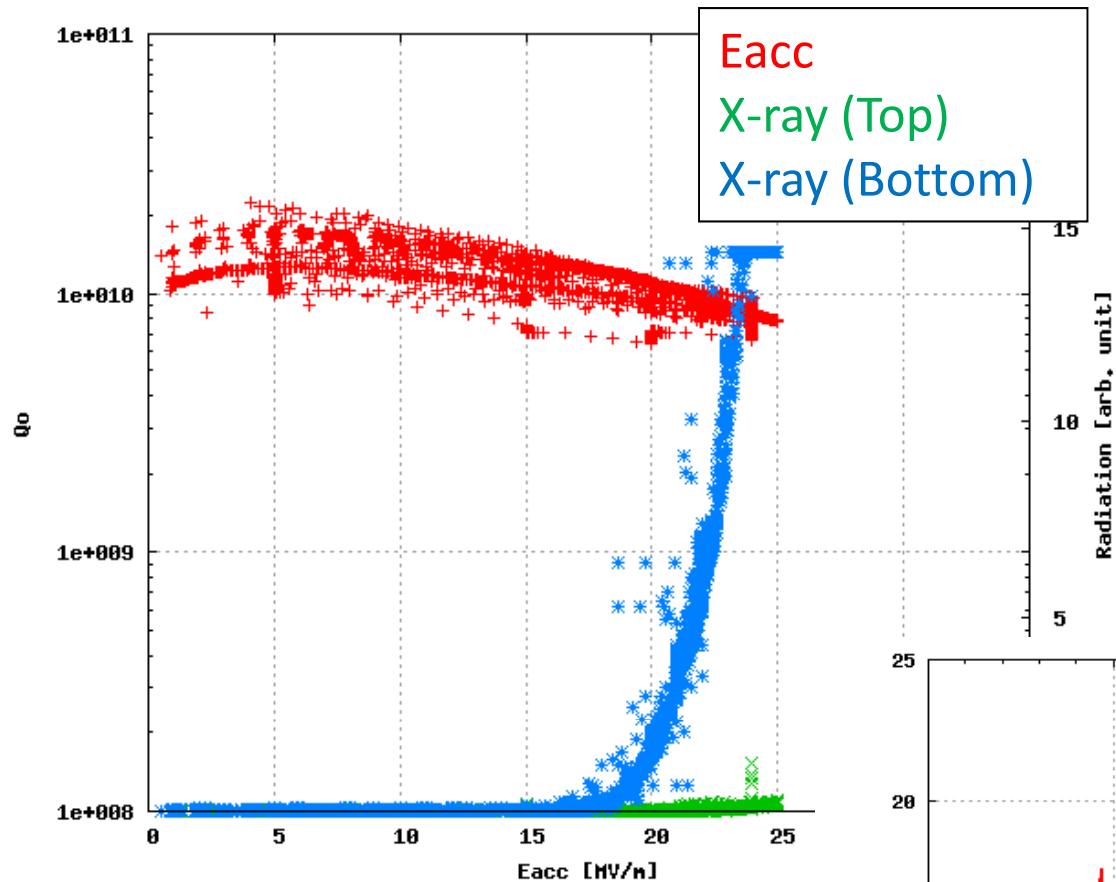

ERL 9-cell #3 cavity

1st vertical test

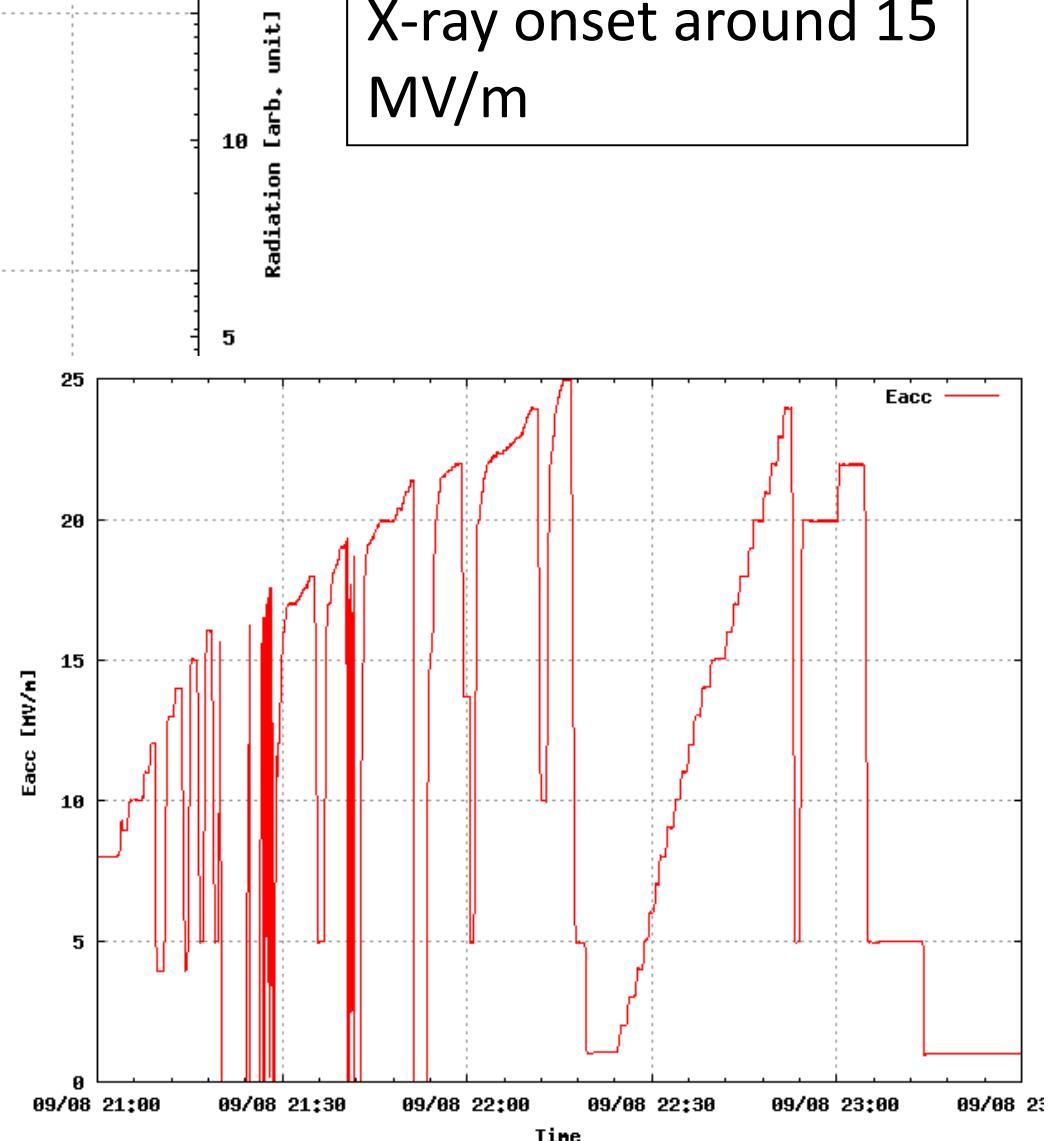

Eacc curve for pi-mode

- Initial (1.5-2.0K), No passband meas, Final (1.9-2.0K)
- Reached to 25 MV/m. Satisfied ERL spec.
- 1.08×10^{10} (@15MV/m), 9.5×10^9 (@20MV/m)
- No limitation up to 25MV/m

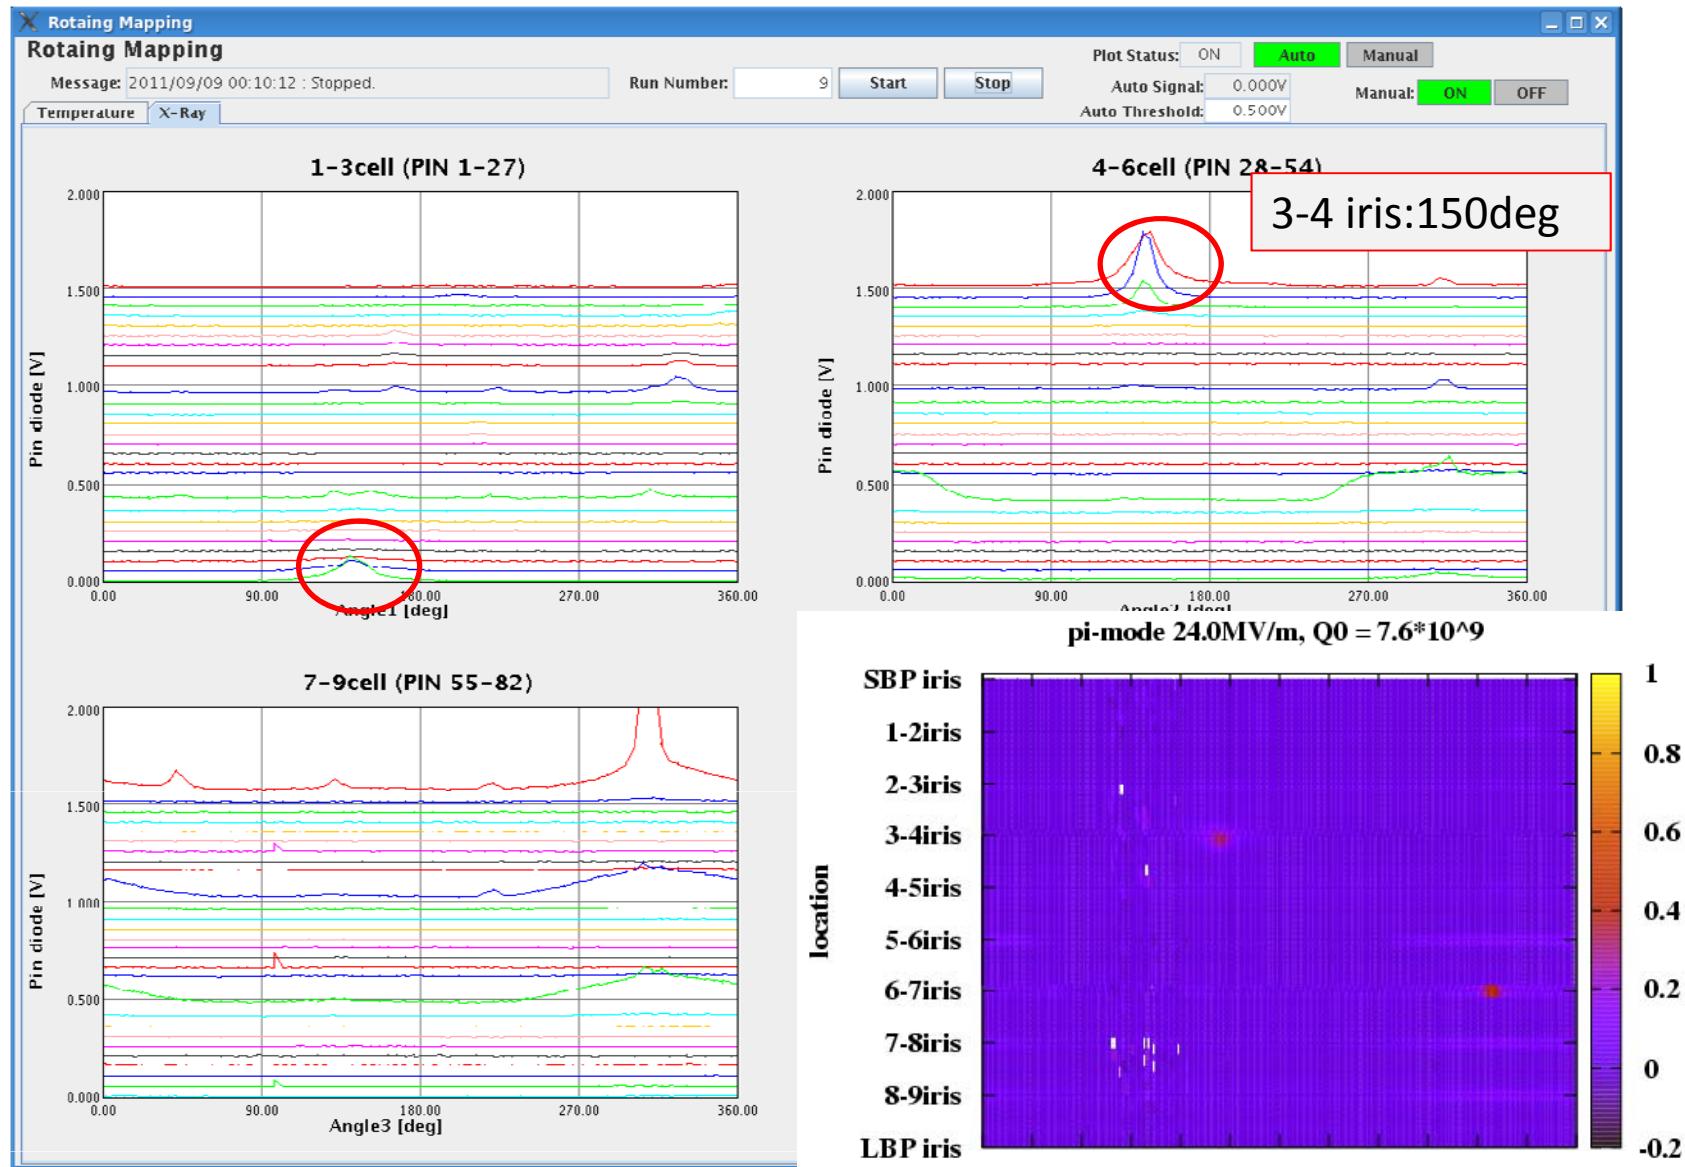

X-ray onset around 15 MV/m

Processed multipacting
from 16 to 22 MV/m.

Temperature rises were
observed at 1-cell and 9-
cell equators.

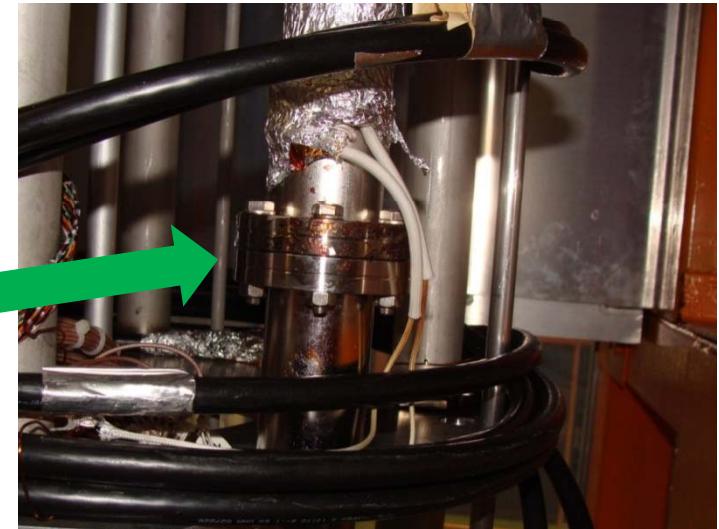

24MV/m X-ray mapping

sharp peak near 3-4 iris: 150deg

5-6,6-7,7-8,8-9 iris : broad signal were observed : peaks are 330deg

Vacuum leak after vertical test

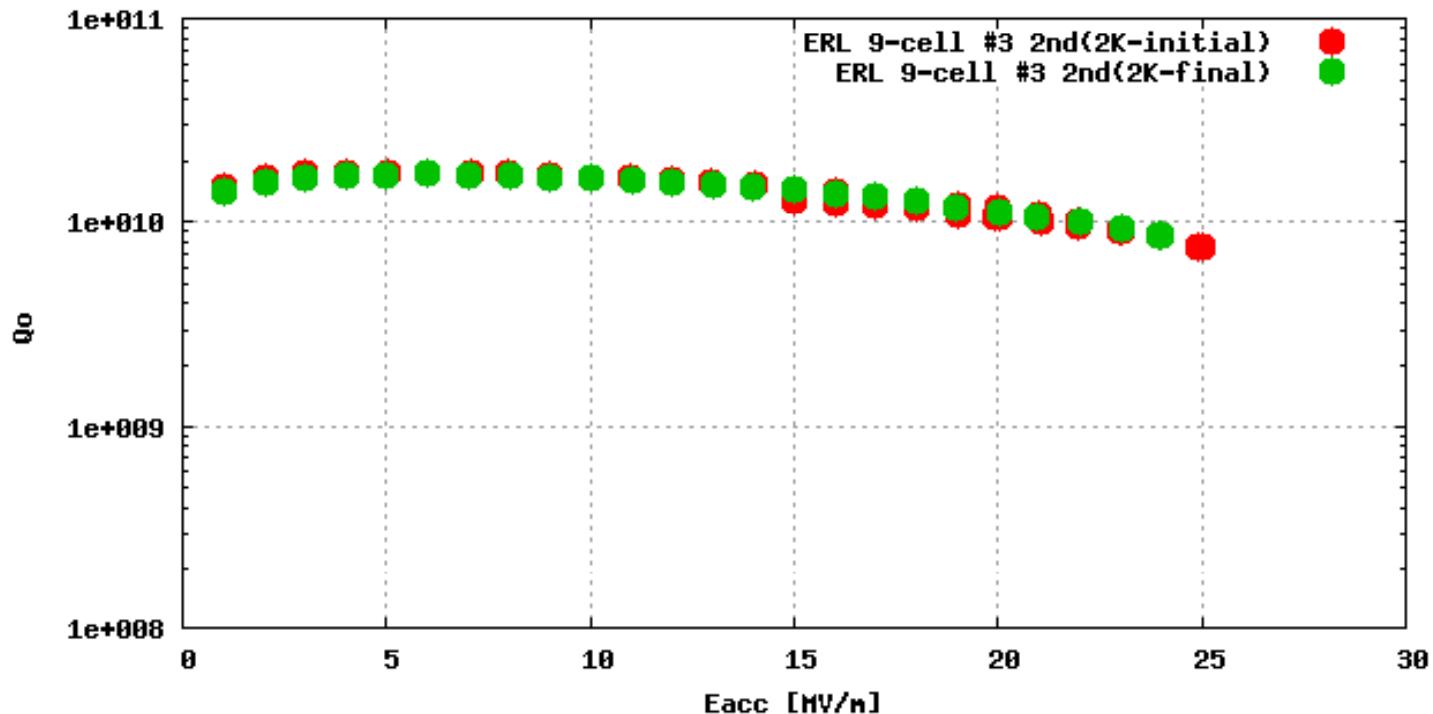

Forgot one bolt to remove, when cavity brought from cryostat

- Cavity was tilted and vacuum pipe got some stress
- Try another EP and vertical test

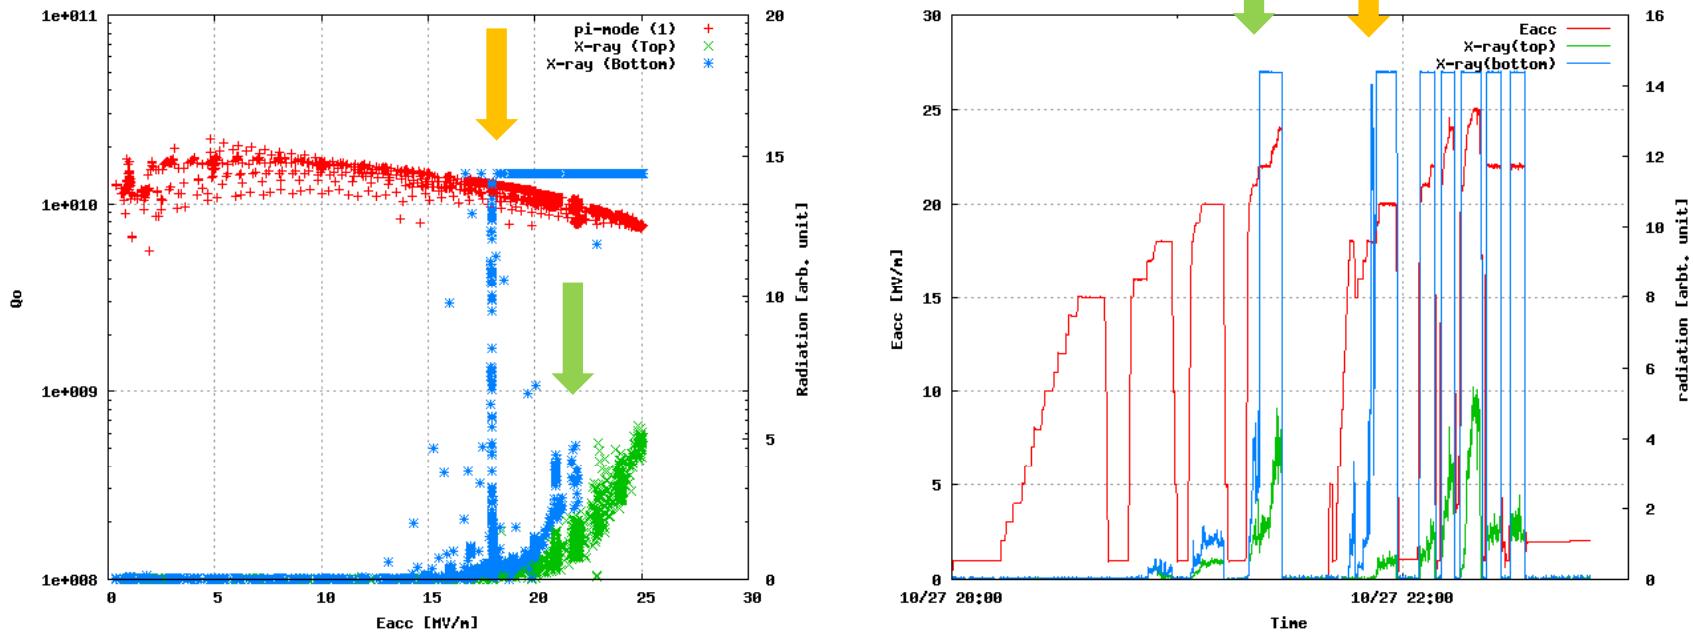

ERL 9-cell #3 cavity
2nd vertical test

2K π -mode measurement

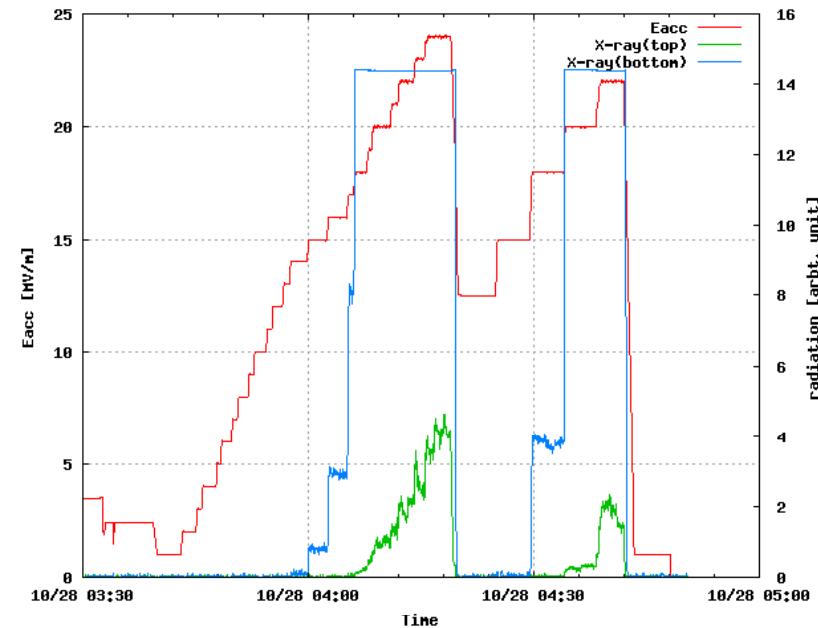

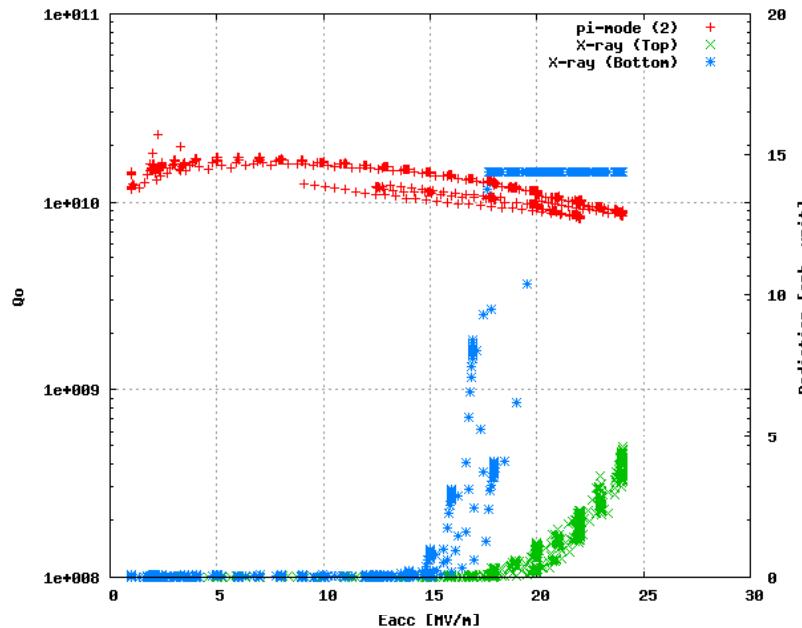

- Initial (1.5-2.0K), Passband(3, 4, 7, 8pi),Final (1.6-1.9K)
- Reached to 25 MV/m. Satisfied ERL spec.
- 1.4×10^{10} (@15MV/m), 1.1×10^{10} (@20MV/m)
- No limitation up to 25MV/m

2K π -mode (initial)

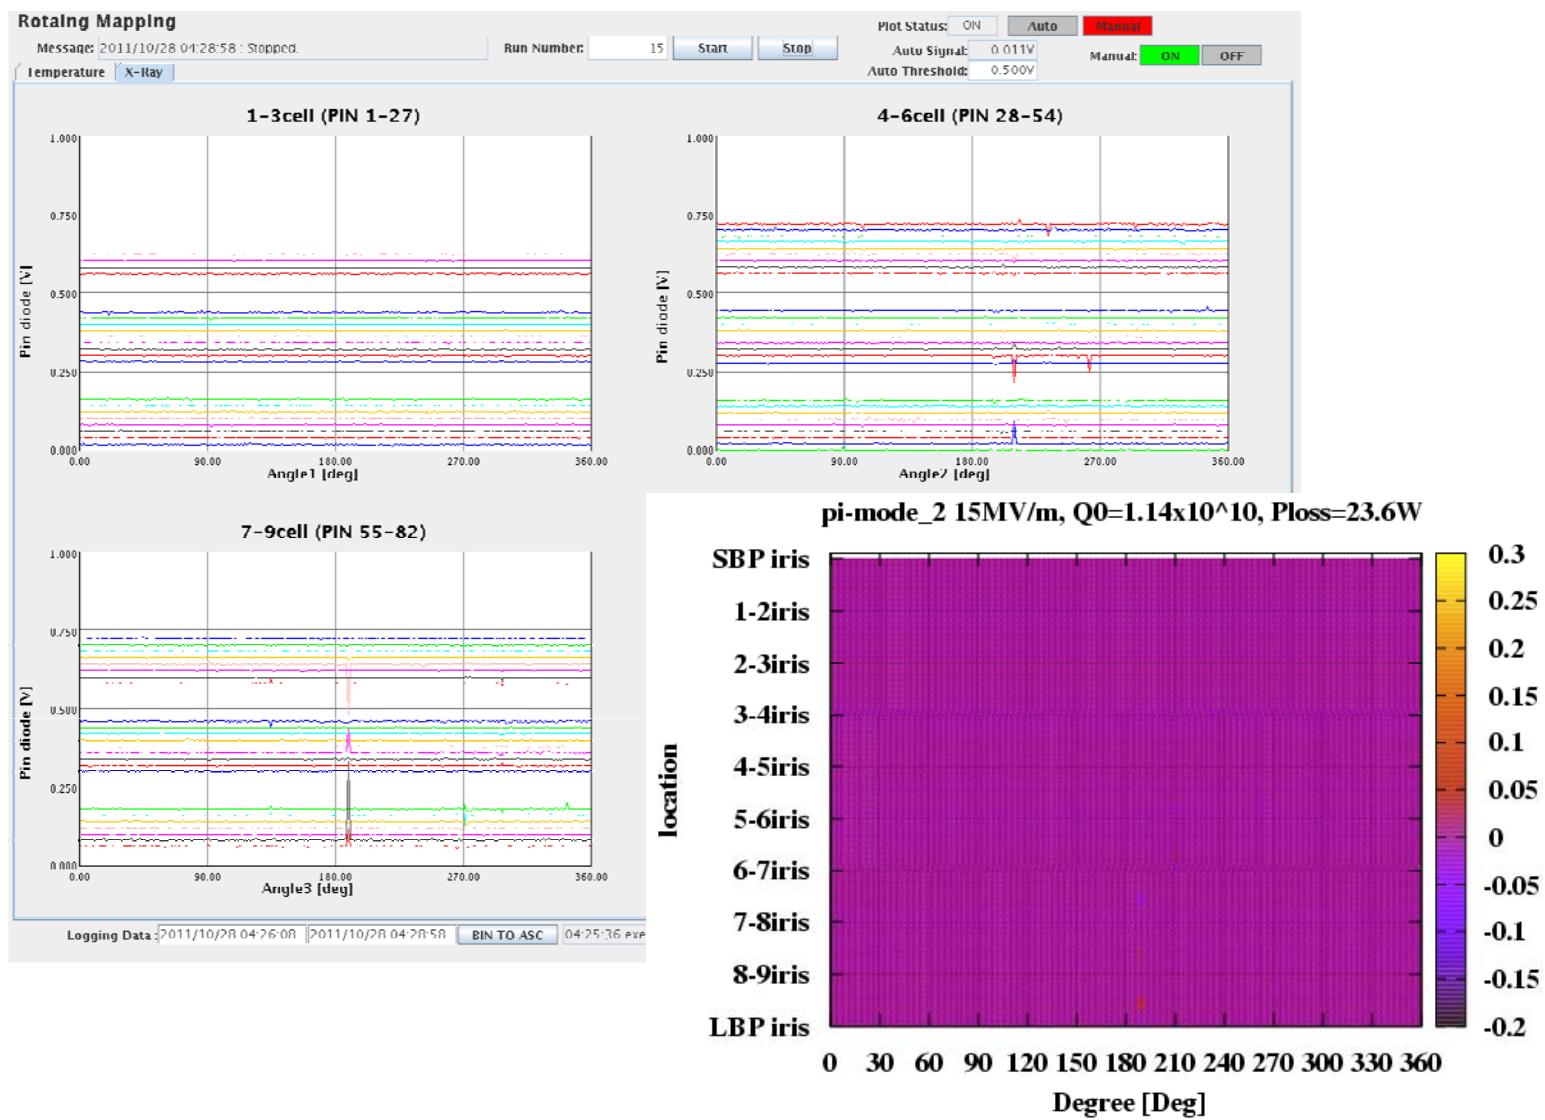

- Field reached to 25 MV/m. No limitation up to 25 MV/m
- One quench occurred around 24 MV/m
- No quenches caused by multipacting were observed
- Strong field emission at bottom side occurred during power rise
- Suddenly X-ray increased at 22MV/m and 18 MV/m

2K π -mode (final)

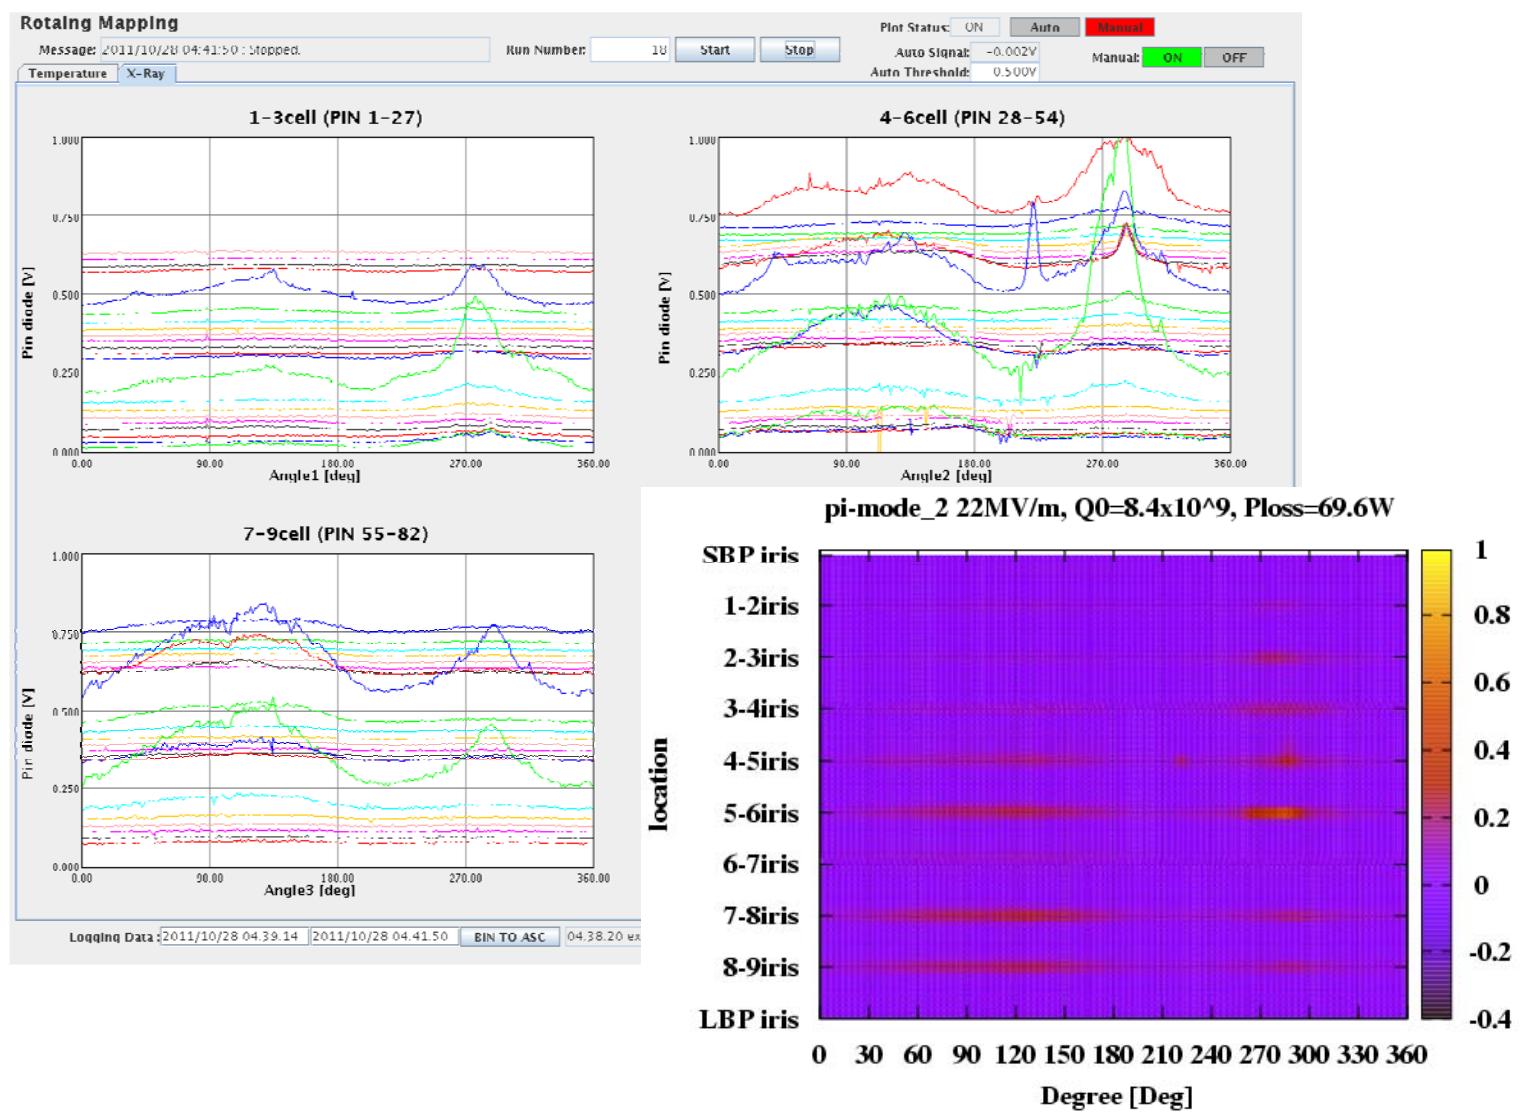

- Field reached to 25 MV/m. No limitation up to 25 MV/m
- Strong field emission at bottom side
- X-ray onset around 14 MV/m

π -mode(final) 15 MV/m

No X-rays were observed

π -mode(final) 22 MV/m

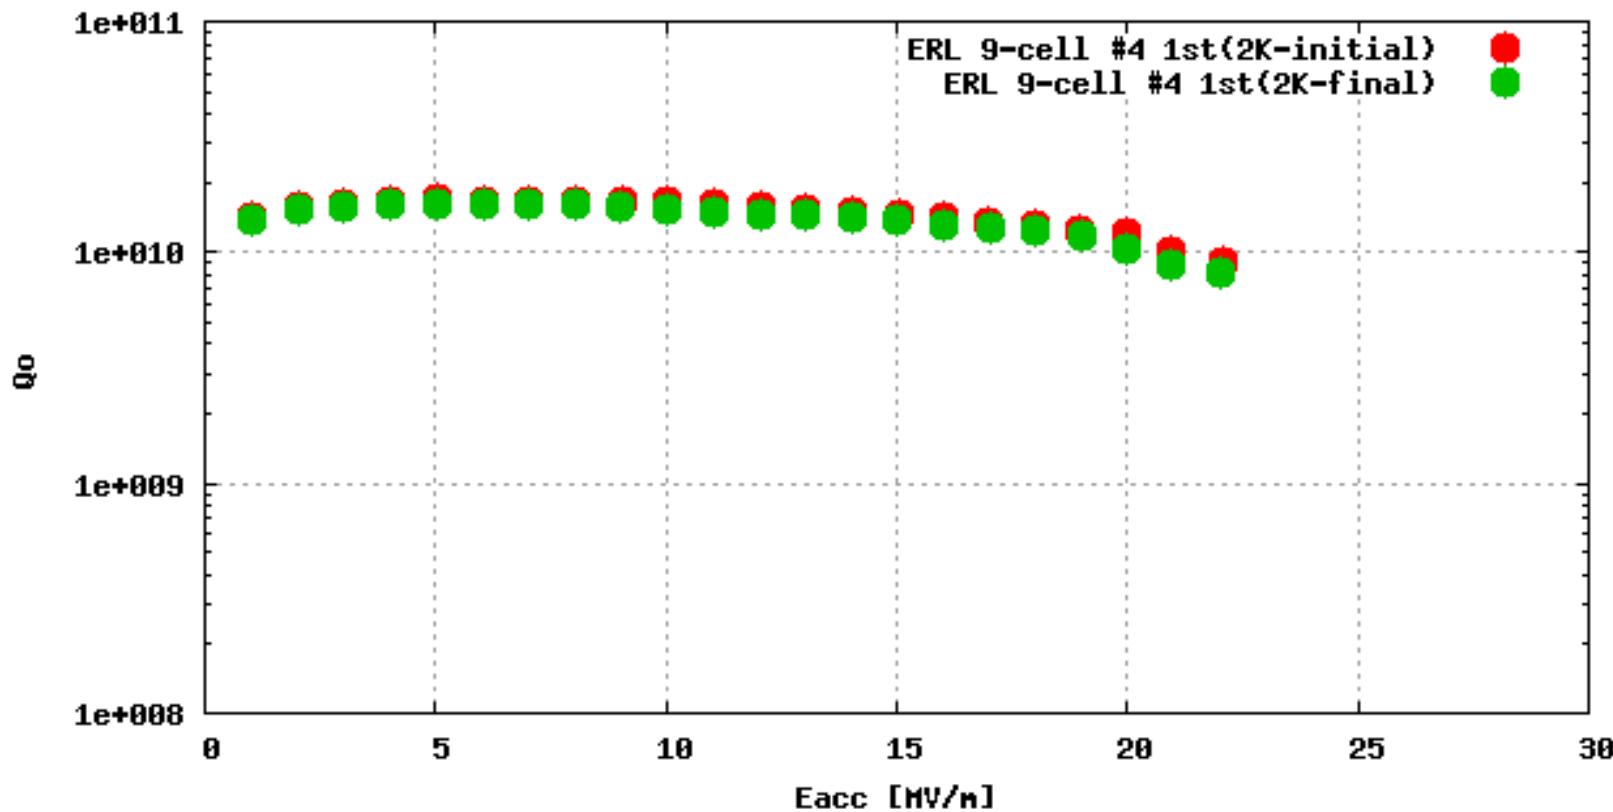

X-rays observed at \sim 100 and \sim 280 degree
 Emitter locations seem to be 4-5 iris and 1-2 iris??

ERL 9-cell #4 cavity

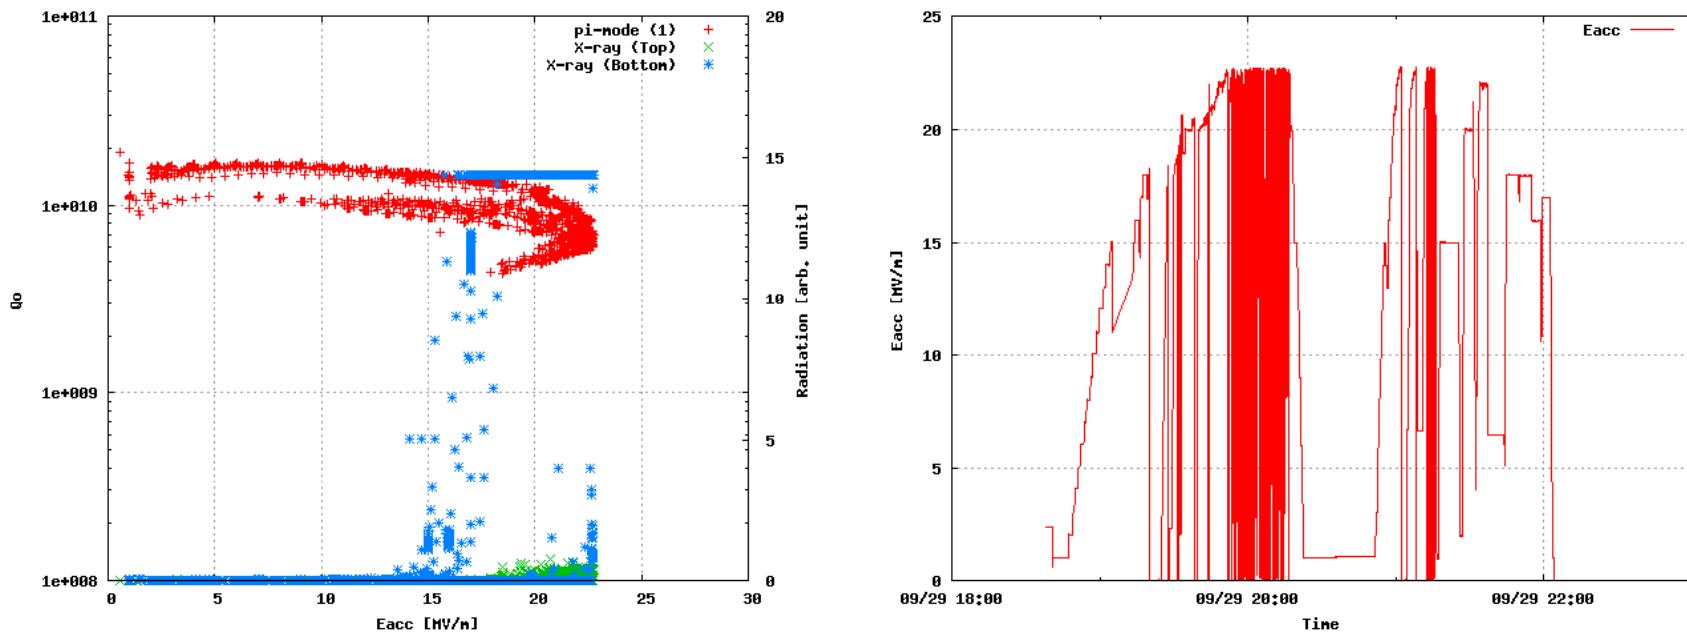

1st vertical test

2K π -mode measurement

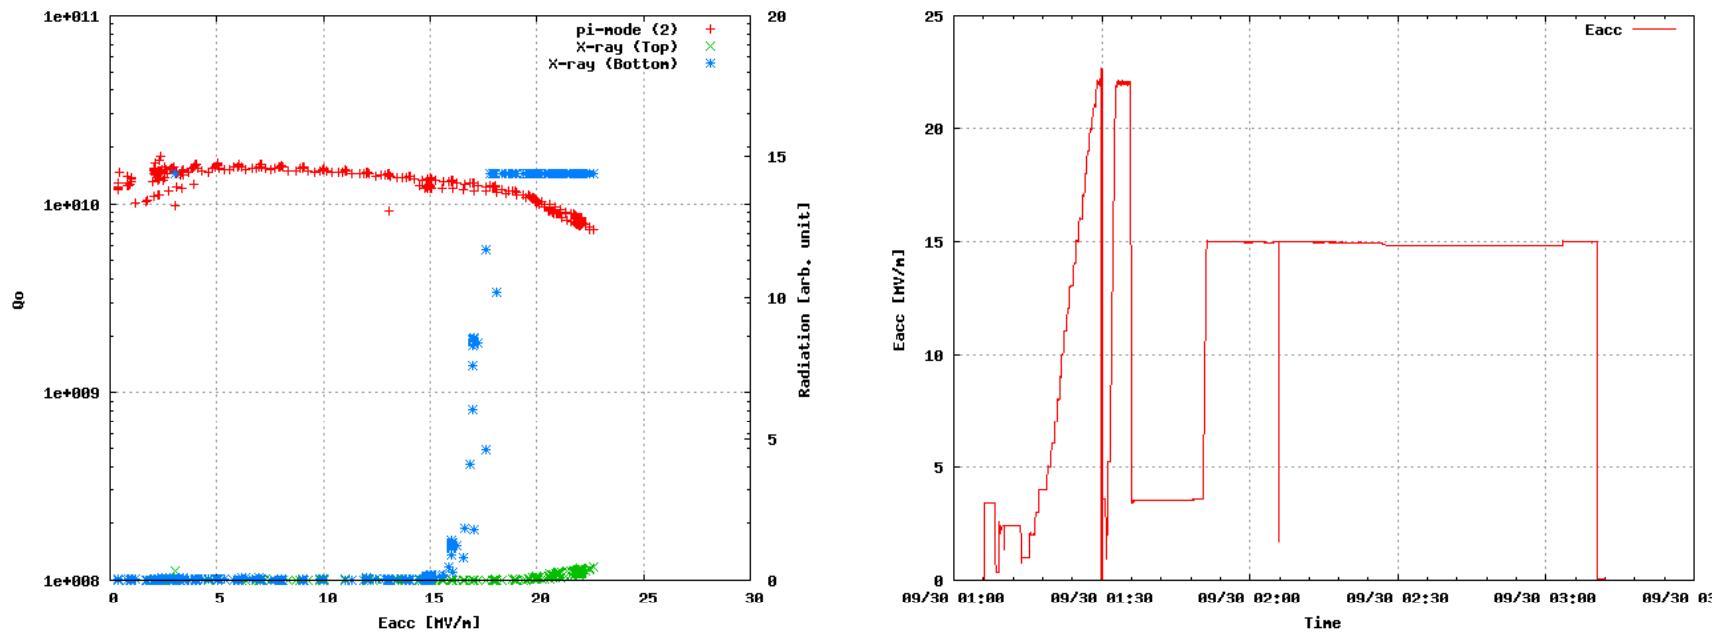

- Initial (1.6-1.8K), Passband(8pi),Final (1.7-1.8K)
- Max. Field 22.7 MV/m, quench at 1 cell equator
- $Q=1.4 \times 10^{10}$ (@15MV/m), 1.0×10^{10} (@20MV/m)
- X-ray on set: (initial) 18MV/m \rightarrow (final) 15MV/m
- X-ray at 20 MV/m: (initial) 3.7 uSv/h \rightarrow (final) 644 uSv/h

2K π -mode (initial)

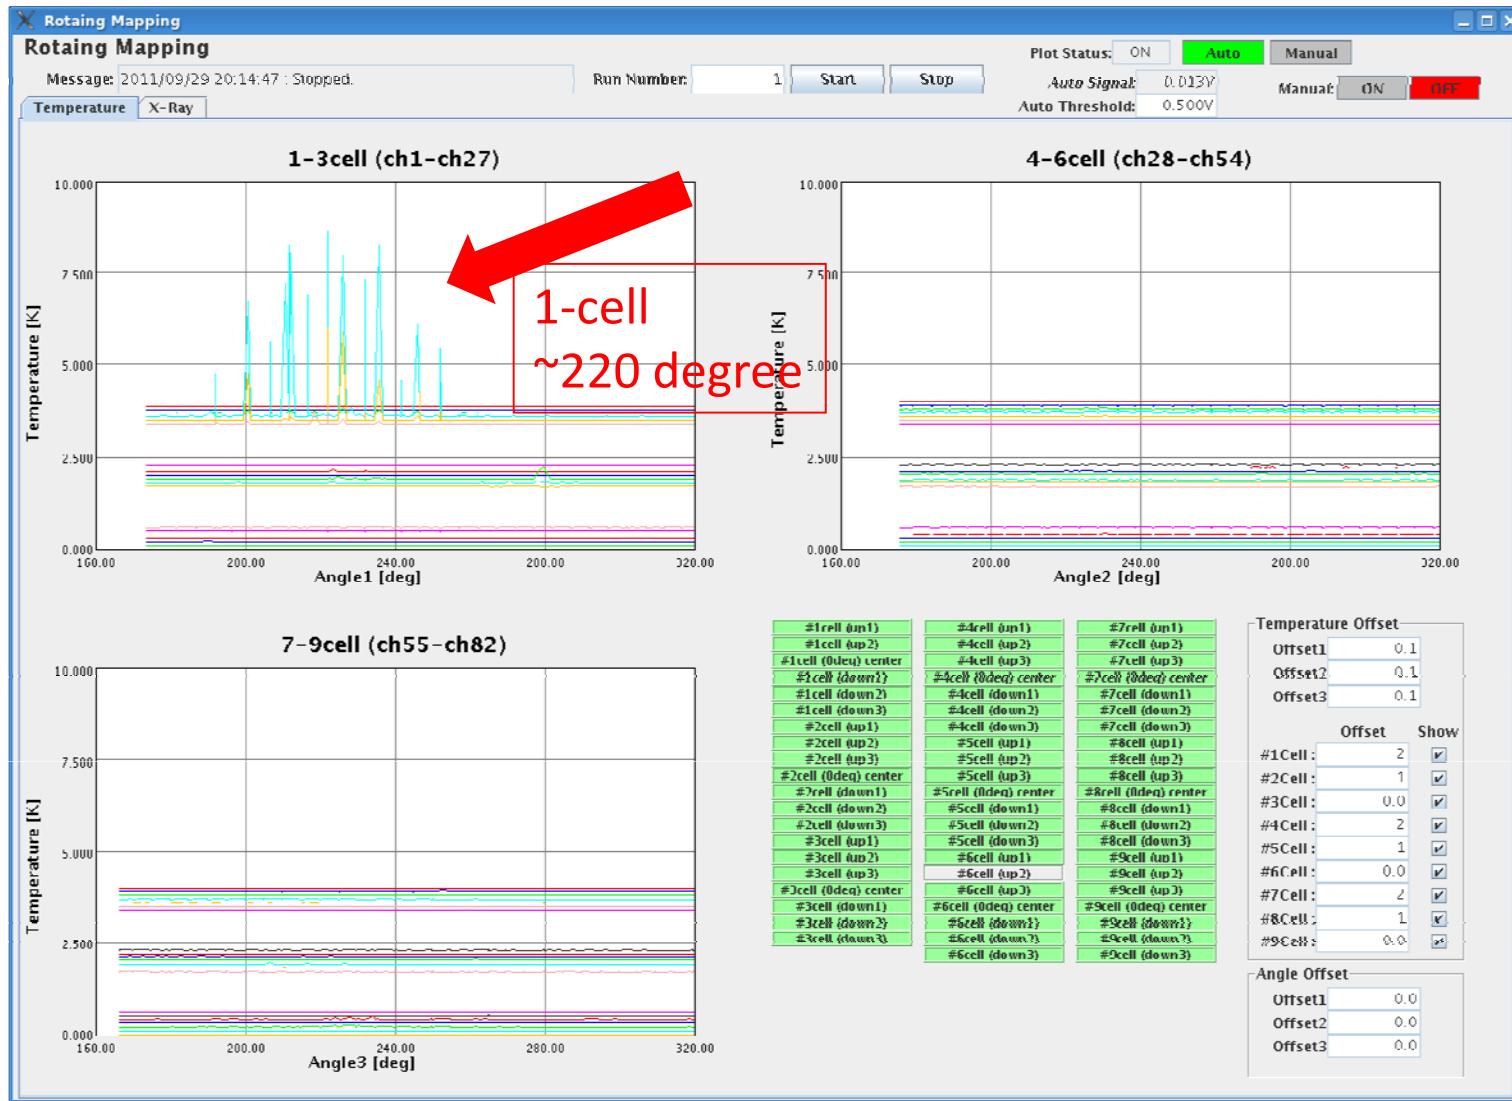

- Quench around 20 MV/m due to multipacting.
- Field was limited at 22.7 MV/m, by quenches observed at 1-cell equator
- Strong field emission at bottom side

2K π -mode (final)

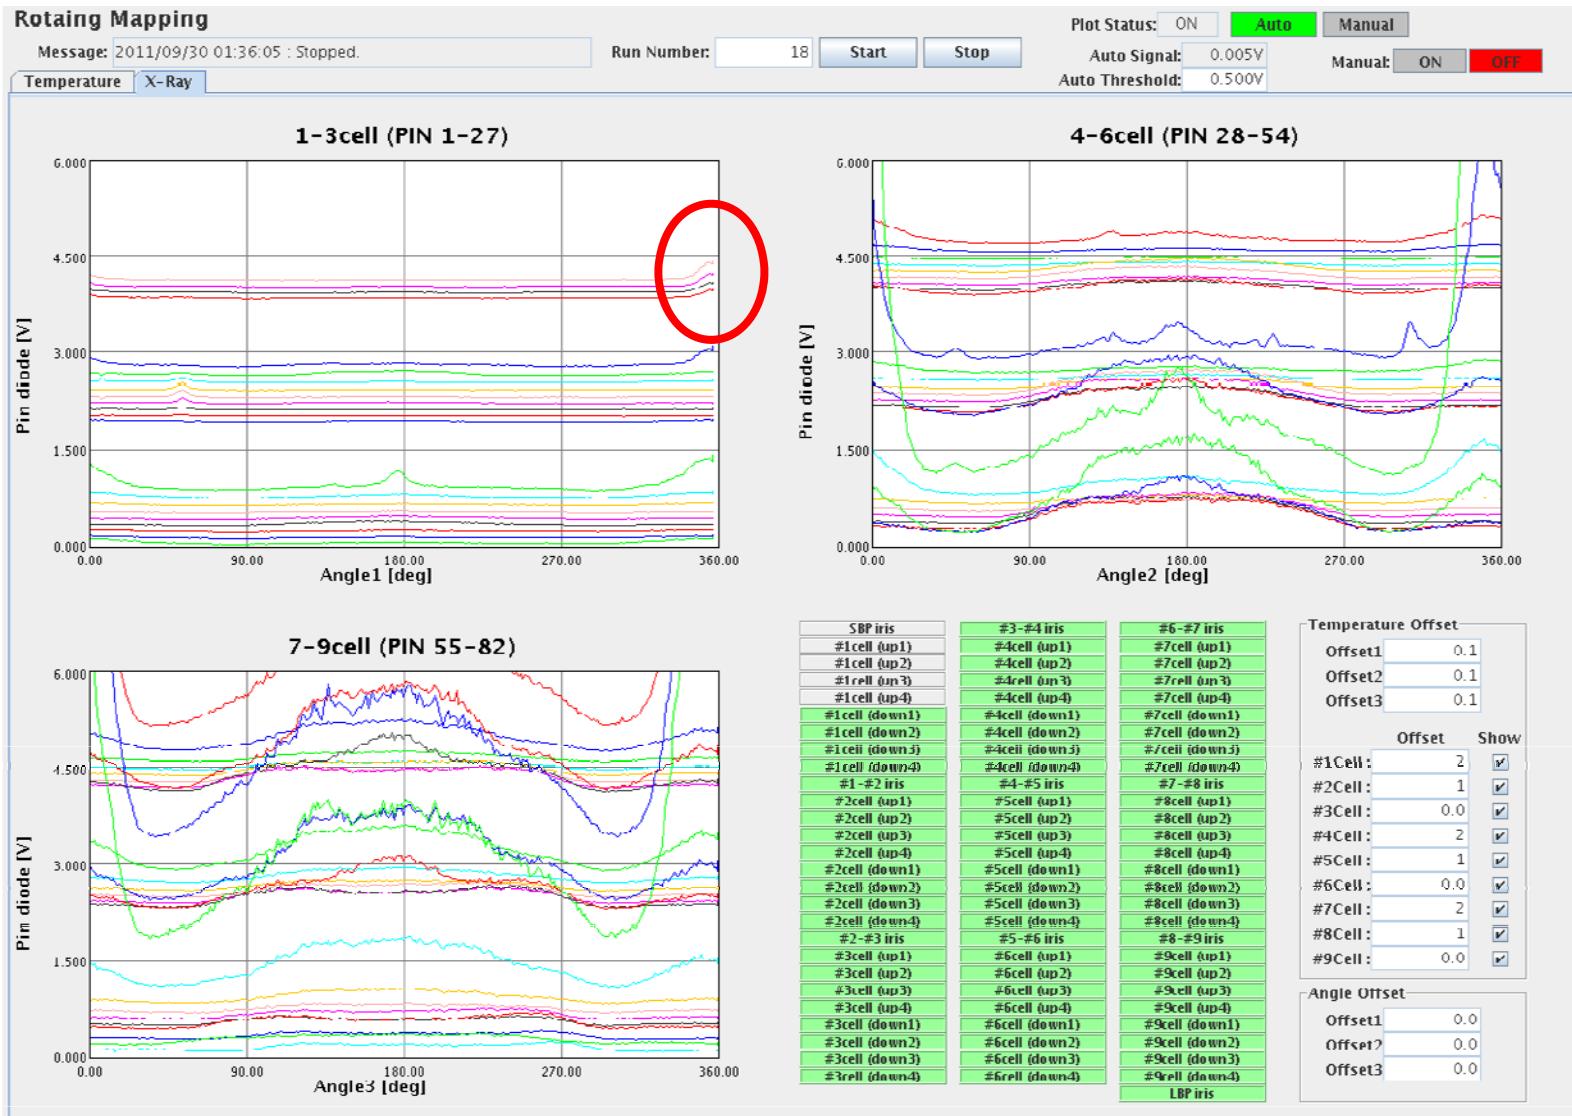

- Field was limited at 22.7 MV/m, by quenches observed at 1-cell equator (\rightarrow surface inspection at this week)
- Strong field emission at bottom side

π -mode: Quench @ 22.7MV/m

Temperature rise was observed during self-pulsing at 1-cell equator ~220 degree.

X-ray: π -mode(2) @ 22 MV/m

Source point seems to be \sim 360 degree of SBP-1cell iris or 1-2 cell iris

Summary

- ERL 9-cell #3 and #4 cavities go forward, to installed into cERL cryomodule.
- **#3 cavity:**
 - First vertical test: Field reached to $> 25\text{MV/m}$, Qo= 1.1×10^{10} (@ 15MV/m , 1.9K), satisfy ERL spec, but vacuum leak happened by mistake.
 - Second vertical test: Field reached to $> 25\text{MV/m}$, Qo= 1.4×10^{10} (@ 15MV/m , 1.6K), satisfy ERL spec
 - Go for He jacket welding
- **#4 cavity:**
 - First vertical test, Field reached to 22.7MV/m (limited by quench), Qo= 1.4×10^{10} (@ 15MV/m , 1.7K), satisfy ERL spec
 - Will another EP and vertical test, hope to reach better performance.

Plan

- Vertical test
 - #3 cavity : finished
 - #4 cavity: next trial at end of November
- Jacket welding
 - From January to March, done at MHI
- Module assembly
 - Scheduled at next summer
