Introduction

Resonant X-ray Raman scattering (RXRS) spectra of TiO$_2$ (rutile) were observed around Ti $K$ absorption edge. Preliminary results of TiO$_2$ as well as BaTiO$_3$ and Ti$_2$O$_3$ have been reported previously [1]. In this report, we compare the Raman spectra with Ti 2$p$ XAS spectrum.

Experimental

Powder samples were used in this experiment. The experiments were performed at BL-7C and 15B1 of the Photon Factory, KEK. X-ray emission was analyzed by a cylindrically bent Ge (400) crystal [2]. The analyzed x-rays were detected by a position-sensitive proportional counter (PSPC).

Results and Discussions

Figure 1 shows Ti $K$ absorption spectra (XAS) of TiO$_2$ and the inset shows pre-edge structure, which correspond to Ti 1$s$ $\rightarrow$ 3$d$ transition [3]. Labels in the inset denote excitation energies in RXRS study.

Figure 2 shows RXRS spectra excited below the absorption edge (red). Labels beside the Raman spectra correspond to those in Fig.1. The RXRS spectra of TiO$_2$ show at least seven peaks (P1~P7).

Three peaks at higher energy (P5~P6) remain those intensity even at much lower excitation energy than absorption edge. The Raman spectrum of low energy excitation (a), which is almost regarded as non-resonant Raman spectrum, resembles to Ti $K$ XAS spectrum (Fig.1). We think these peaks correspond to Ti 4$p$ state in the unoccupied state; i.e. Raman scattering by Ti 2$p$ $\rightarrow$ 4$p$ excitation. In such non-resonant condition, monopole transitions should be active.

Ti 2$p$ XAS spectrum, which reflects Ti 3$d$ state in unoccupied state, is shown at the top. As shown in spectrum b in Fig.2, Raman peaks at lower energy (P1~P4) are enhanced by the excitation just below the pre-edge structure of the Ti $K$ XAS and the Raman spectrum become very similar to the Ti 2$p$ XAS. Since the Ti 3$d$ state would be enhanced by such an excitation energy, we think these Raman peaks correspond to unoccupied Ti 3$d$ state, i.e. Raman scattering by Ti 2$p$ $\rightarrow$ 3$d$ excitation. In such a resonant condition, dipole transitions, which are forbidden in normal condition, would become active.
