An aerial photograph of the KEK (High Energy Accelerator Research Organization) and PF (Photon Factory) facilities in Tsukuba, Japan. The image shows a large complex of white buildings and green spaces in the foreground, surrounded by a mix of green fields and residential areas. In the background, there are large, dark mountains under a blue sky with some clouds. The text is overlaid in red on the image.

Introduction on the experimental application of
pulsed photon beam by means of single-bunch
operation at the PF and PF-AR

KEK, PF

Hiroshi Kawata

PF(2.5GeV) and PF-AR(6.5GeV)

PF-AR
6.5GeV
Single bunch operation: 100%

PF
2.5 GeV
Single bunch operation: ~10%

Experimental application of pulsed photon beam (2)

Experimental applications based on the time-domain experimental techniques

#) Time-gated technique

#) Time of flight technique

#) ,,etc.

Development of the time resolved detection system

1) Nuclear resonant scattering

2) Lifetime resolved fluorescence spectroscopy

3) Electron spectroscopy at Compton scattering process

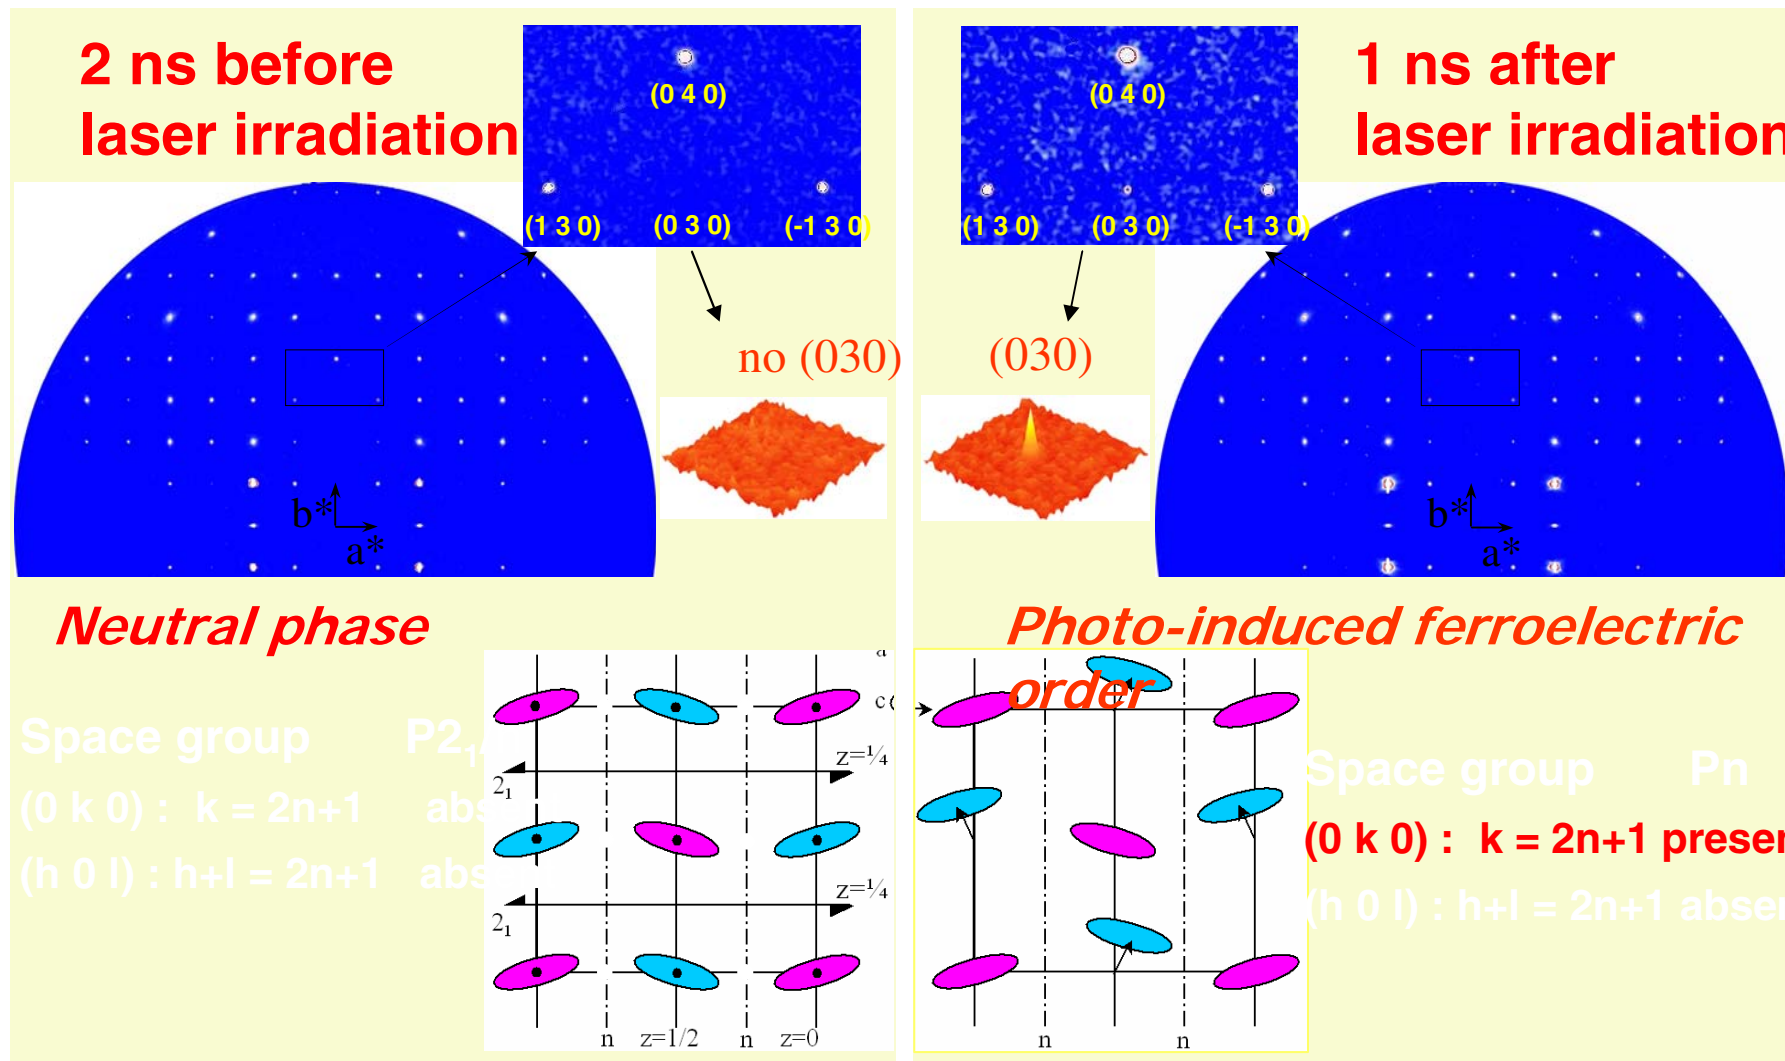

4) ,, ,, ,, ,, ,, ,, ,,etc.

Sub-nano second time-resolved X-ray diffraction experiment at PF-AR (Photo-induced phase transition)

Neutral-to-Ionic Transition in TTF-CA

(Collet et al. Science 300, 612, 2003)

XAFS of Short-Lived Species

Electronic State Analysis

Time-Resolved XAFS

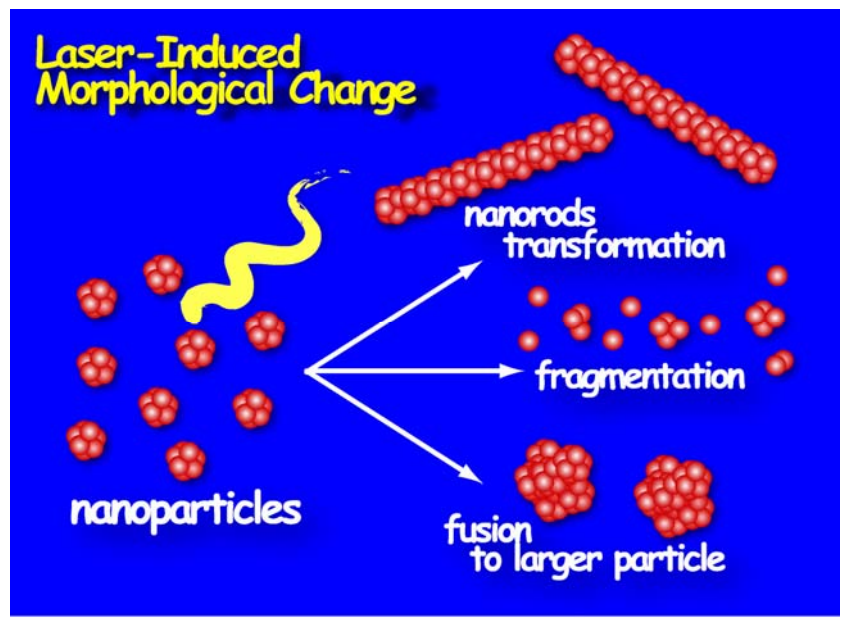

Light-Excited Species

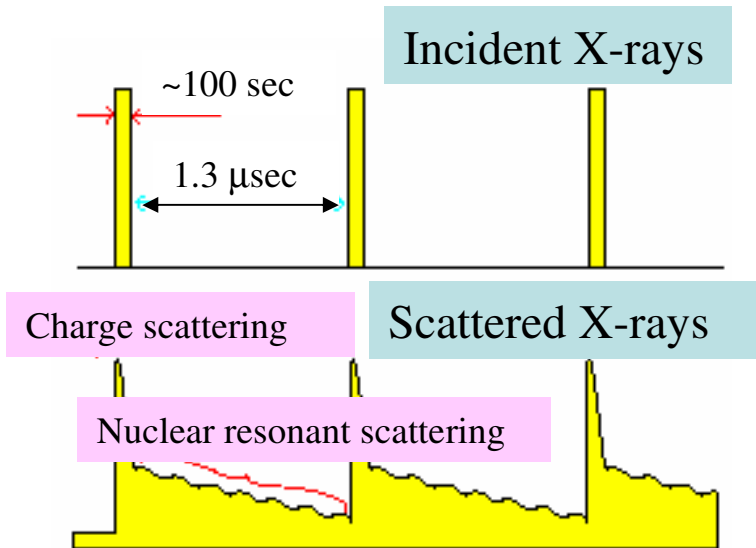

Water-Splitting Catalyst

Formation Mechanism of Nanomaterials

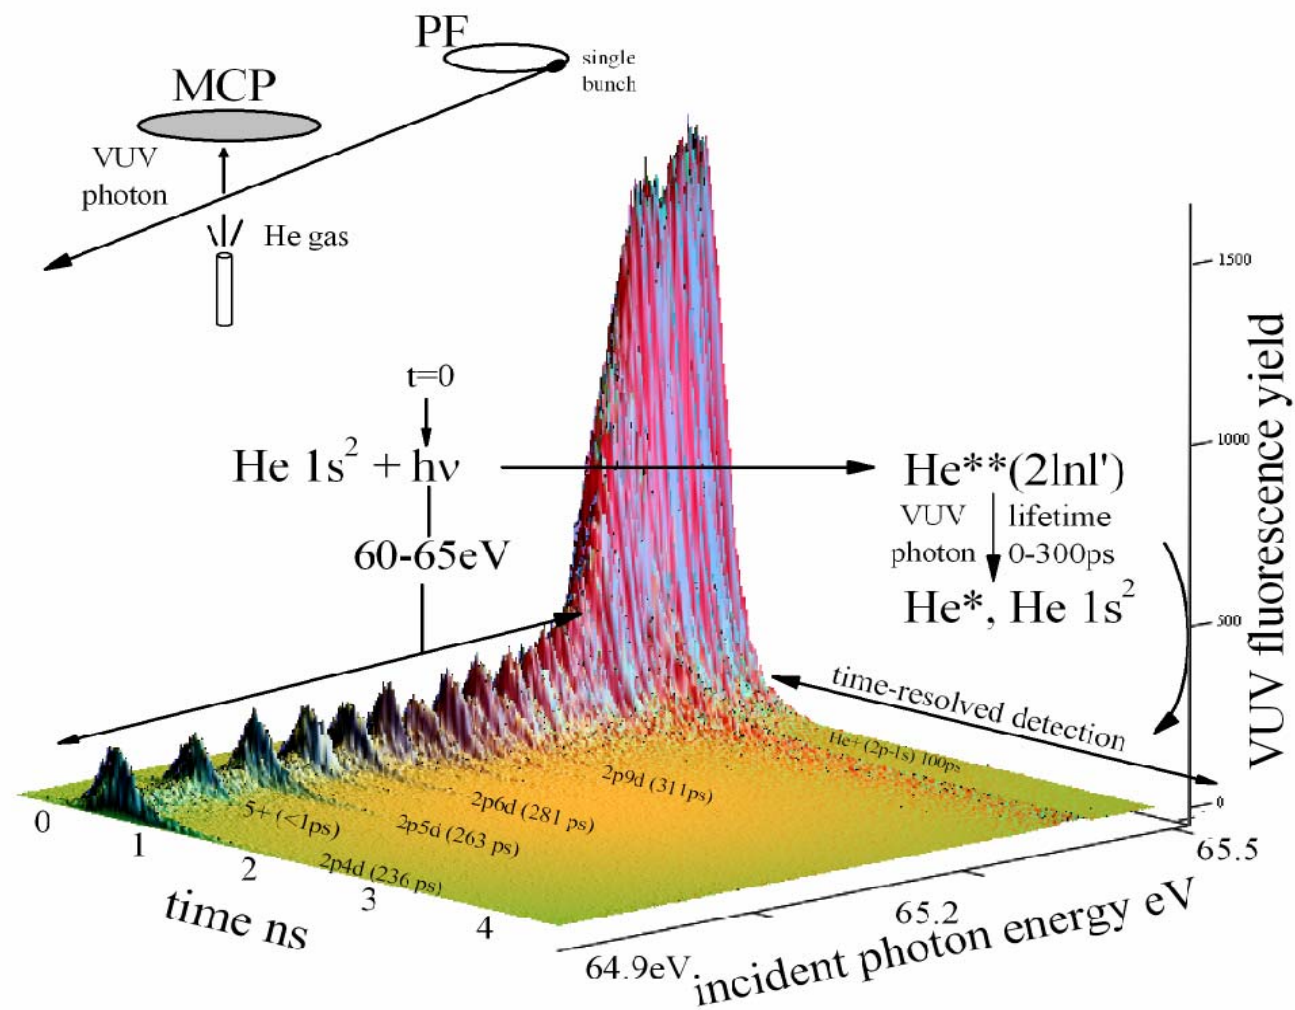

Nuclear resonant scattering under high pressure condition

Pressure effect of mixed valence iron complex system, $(n\text{-C}_3\text{H}_7)_4\text{N}[\text{Fe}^{\text{II}}\text{Fe}^{\text{III}}(\text{dto})_3](\text{dto}=\text{C}_2\text{O}_2\text{S}_2)$

Lifetime-resolved fluorescence spectroscopy

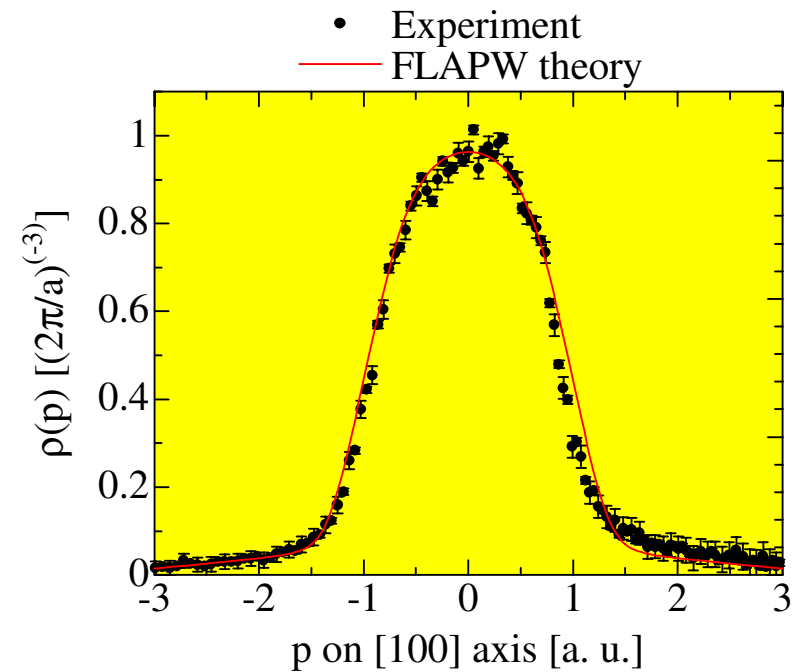

Time and incident photon energy dependence of fluorescence yield on He

Electron spectroscopy at Compton scattering process

Time of flight method

Obtained electron momentum density at Si

Avalanche diode detectors

A silicon avalanche photodiode (Si-APD) detector is a powerful tool for Synchrotron X-ray experiments.

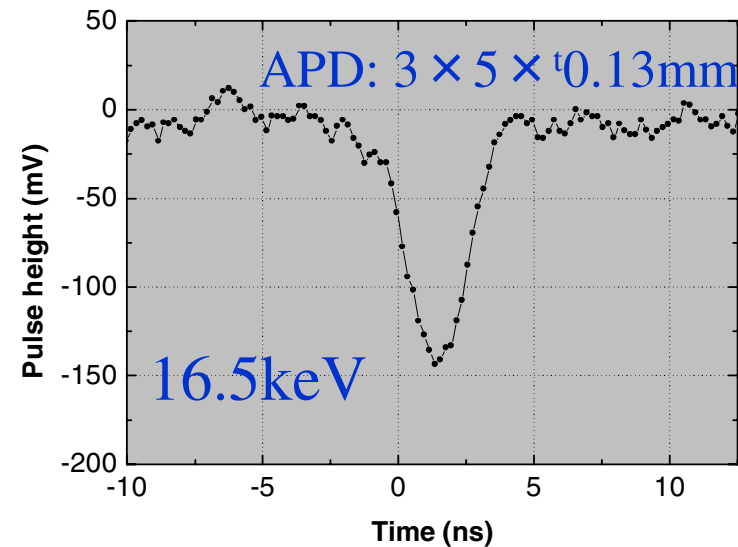

Detecting radiation Without a scintillator

Processing signals With a wide-band amplifier (gain>100)

→ a nanosecond-width pulse for one X-ray photon

high-rate capacity : up to 10^8 s⁻¹

time resolution : < 50ps – 1.5ns

Nuclear Excitation by Electron Transition (NEET)

Ex. ^{197}Au

K-holes are made by ionization, and filled by an atomic transition from an outer orbit.

The nucleus is excited, followed by emitting radiation with a lifetime of the excited level.

Future development

#) Much shorter light pulse!!

Pico second → Femto second

#) What kind of hardware will be available in a future??

Thank you for your attention!!
