

PF研究会:放射光利用による構造生物学の将来像

# 放射光回折データから いかに最大の構造情報を引き出すか

—超高分解能および中・低分解能での結晶構造解析—

京都大学大学院理学研究科

三木 邦夫

2010.7.13 高エネルギー加速器研究機構研究本館小林ホール

# 含まれる情報を最大限に引き出す構造解析

## 高分解能・高精度構造解析

### 高精度の原子座標

高い信頼度の結合距離情報

原子振動・分子運動の評価

水素原子の実験的決定

電子密度解析(結合電子,  $d$  電子)

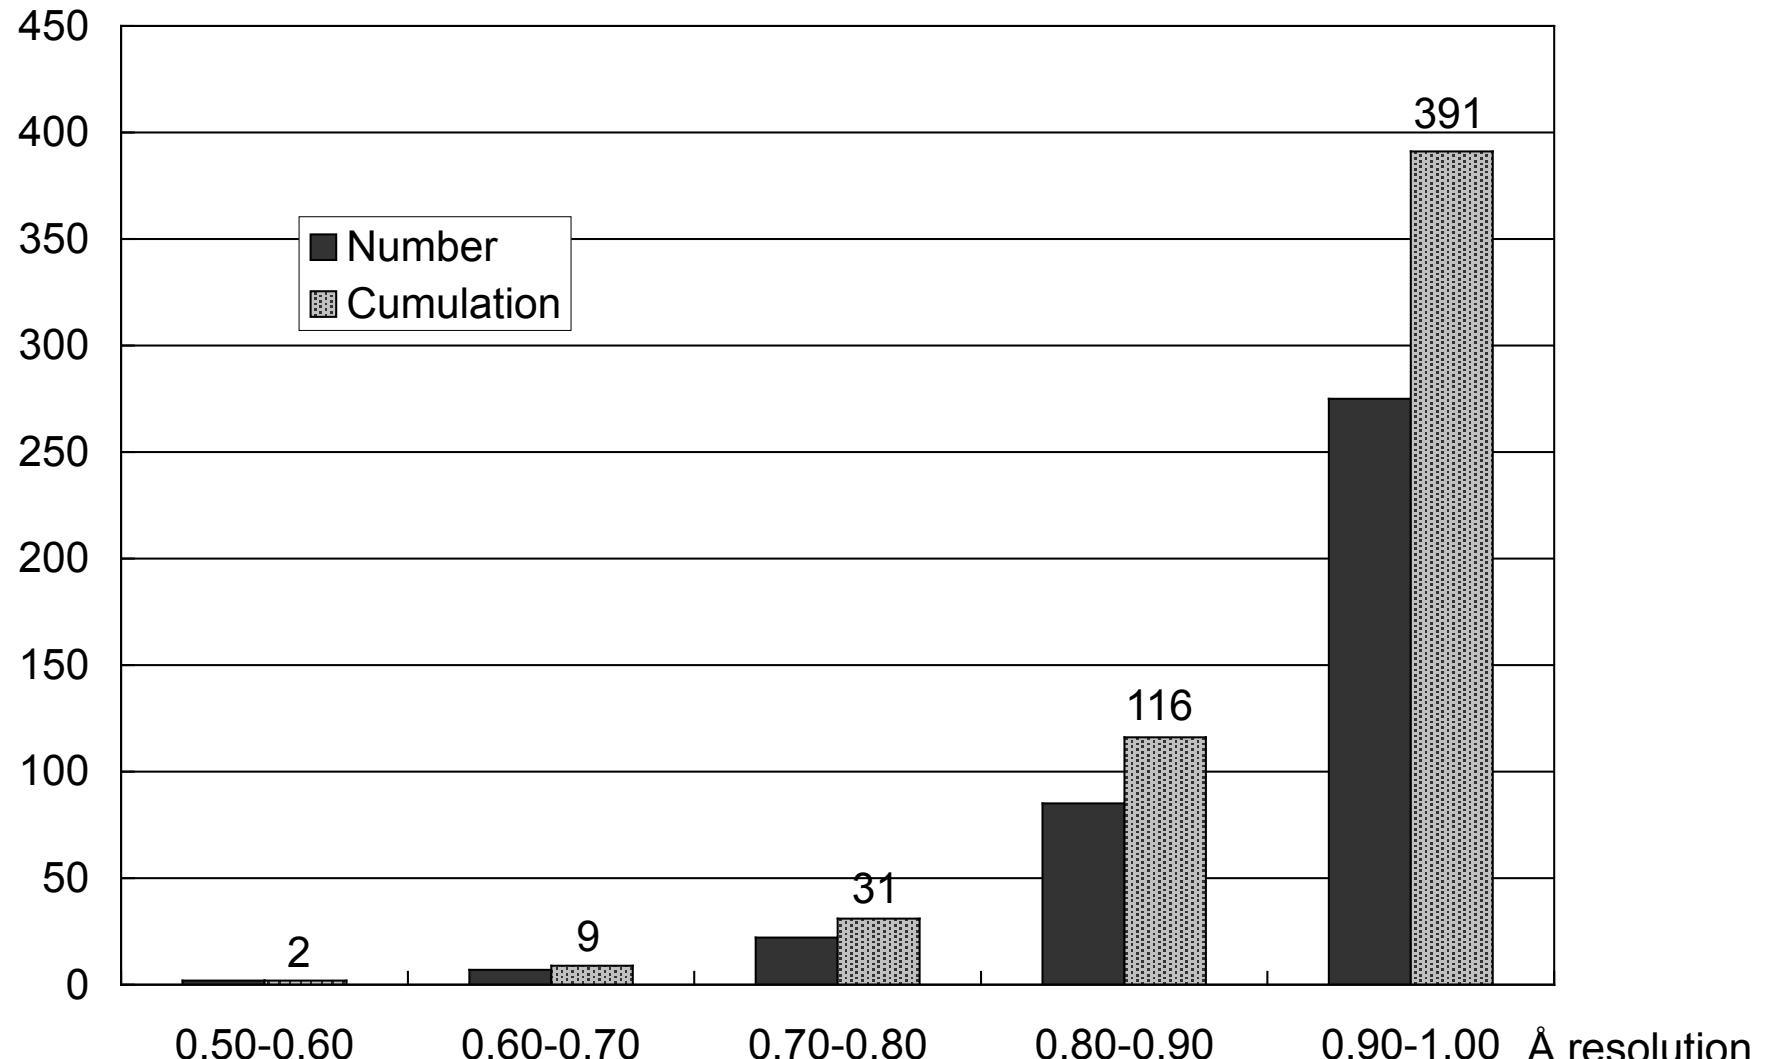

タンパク質分子での化学結合論

## 低分解能・中分解能構造解析

### あいまいな電子密度からの確かな構造情報

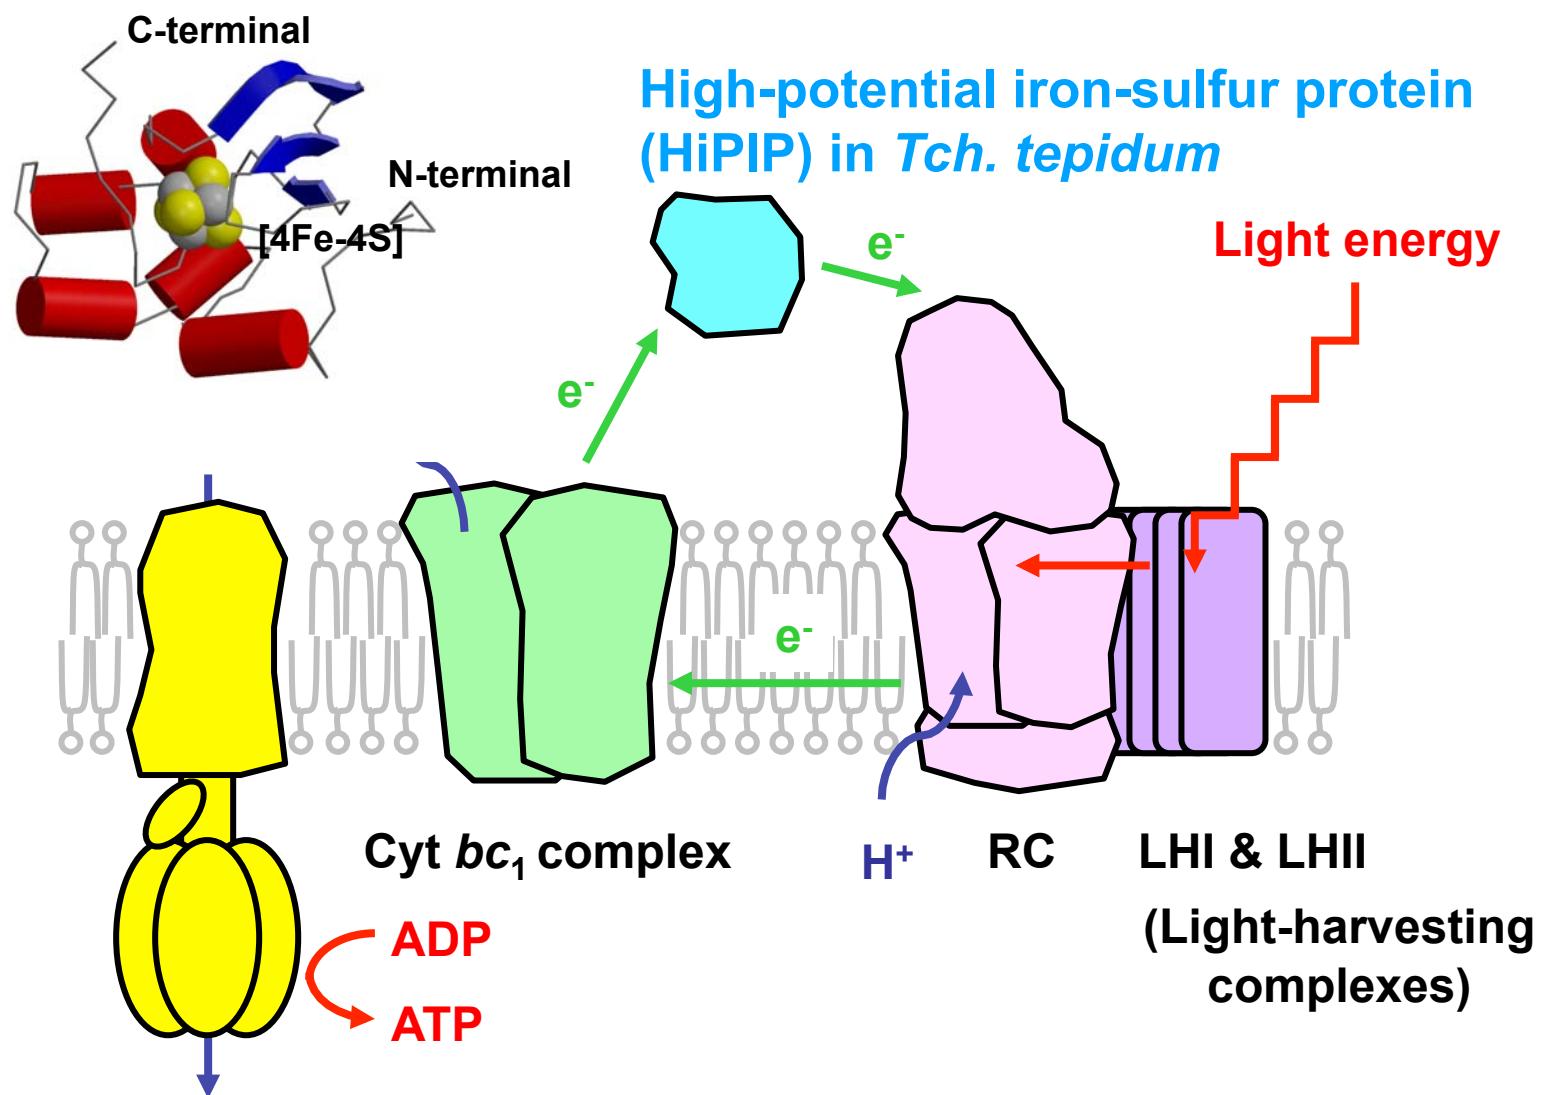

リガンド結合部位

二次構造, 三次(ドメイン)構造, 四次構造の変化

Structures  $\geq 1 \text{ \AA}$  resolution are 0.69% of total entries for X-ray (56,680)  
in PDB on May 25, 2010

# Photosynthetic electron transfer in purple bacteria

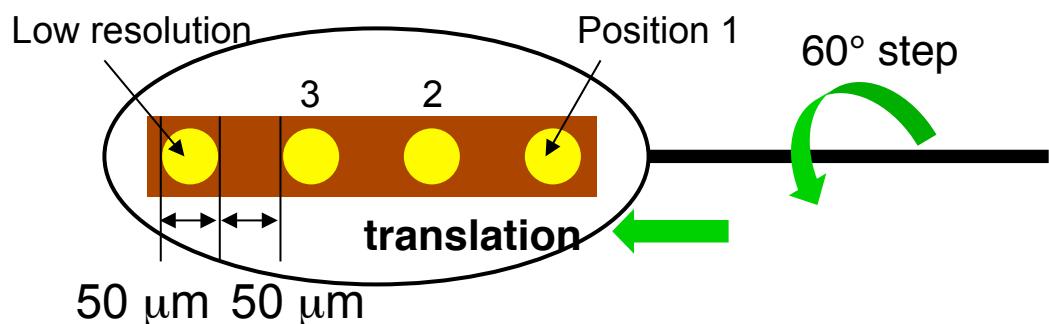

1.5 Å 分解能 (BL-6A, PF)  
0.8 Å 分解能 (BL40B2)

T.Nogi et al., Proc. Natl. Acad. Sci. USA, 97, 13561-13566 (2000).  
L. Liu et al., Acta Crystallogr., D58, 1085-1091 (2002).

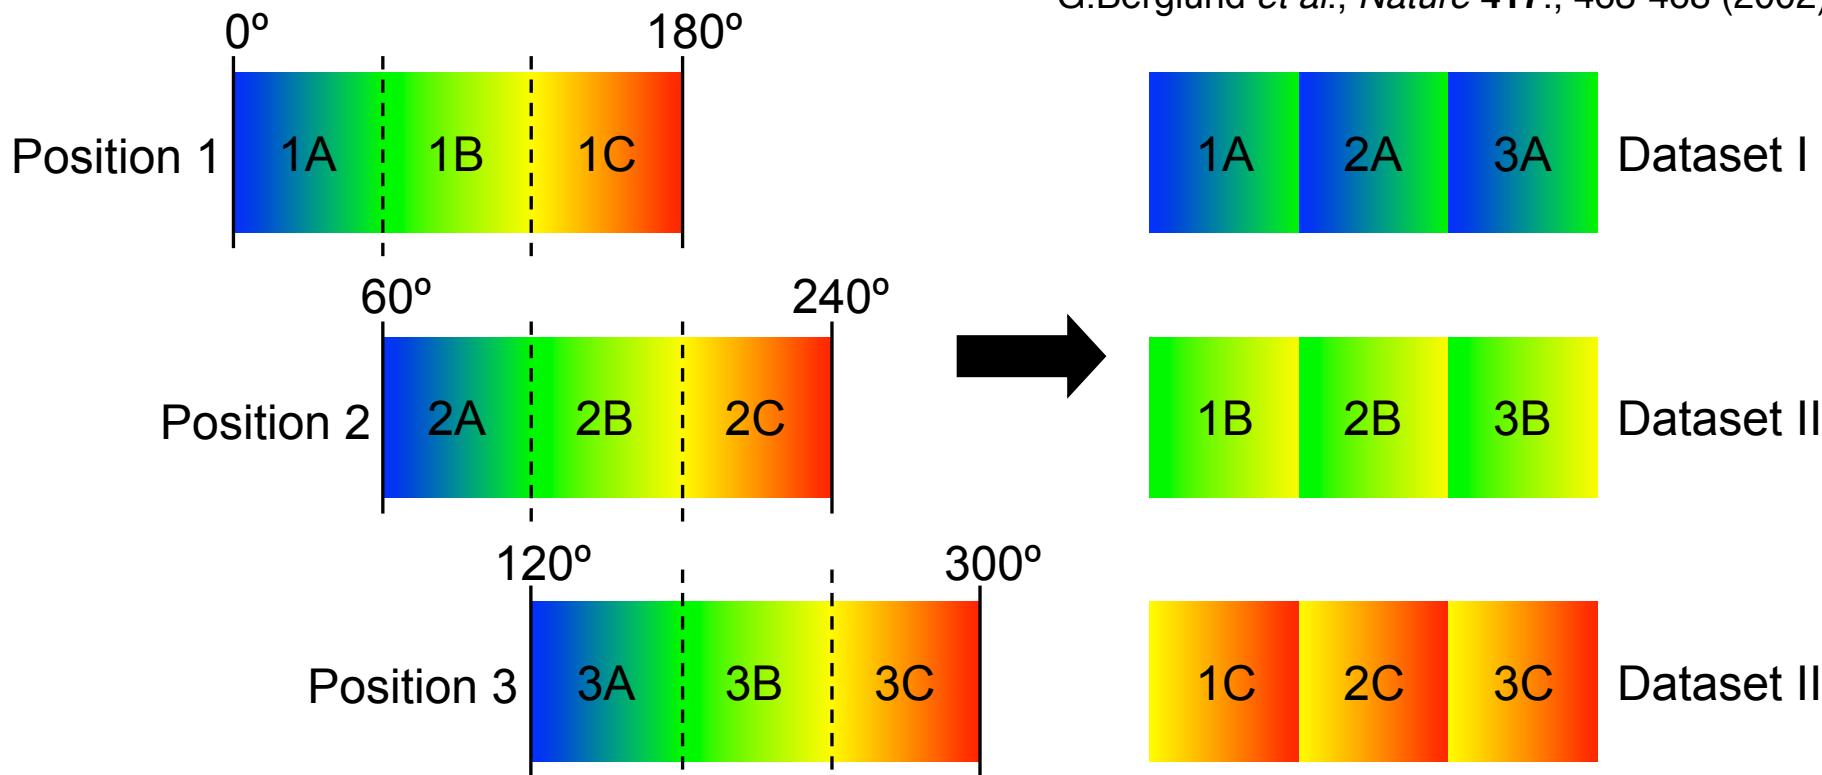

# HiPIP at 0.7 Å resolution:

## Data collection to survey structural perturbation induce by X-ray damage

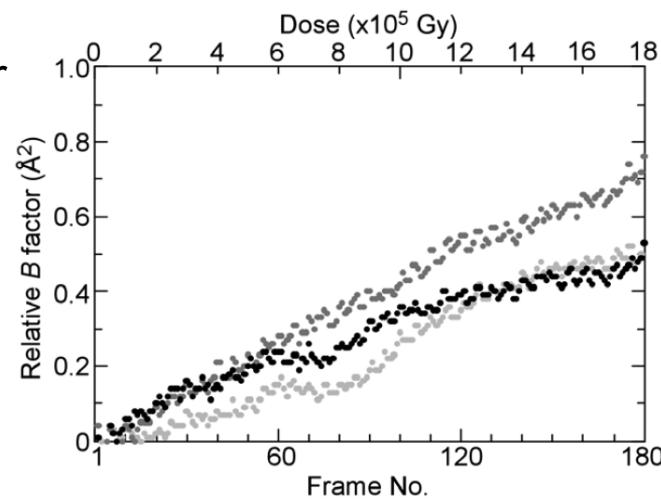

SPring-8 BL41XU  
Wavelength: 0.71 Å  
Detector: ADSC Q315  
Temperature: 93 K  
Oscillation range: 1°  
Exposure time: 2 sec

G.Berglund *et al.*, *Nature* **417**., 463-468 (2002)

# HiPIP at 0.7 Å resolution: Changes in crystallographic parameters and statistics for the three incident positions of the crystal.

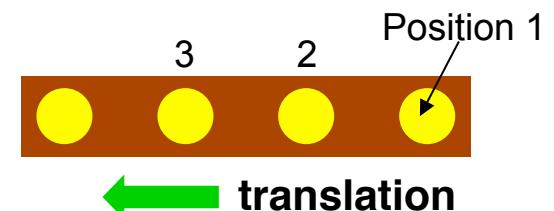

**a: Relative *B* factor**

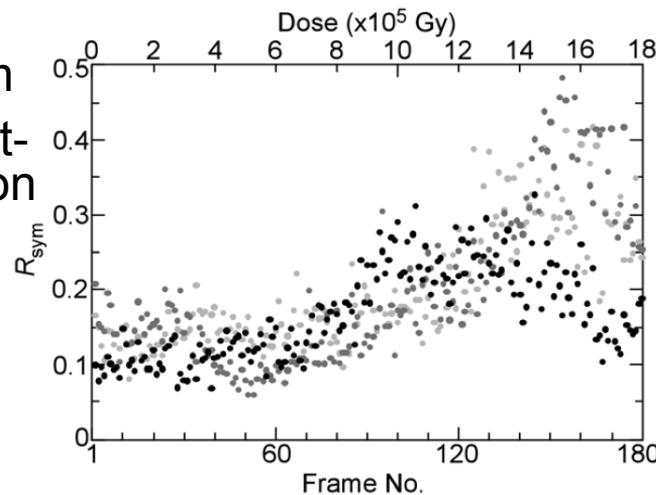

Gray: position 1

Dark gray: position 2

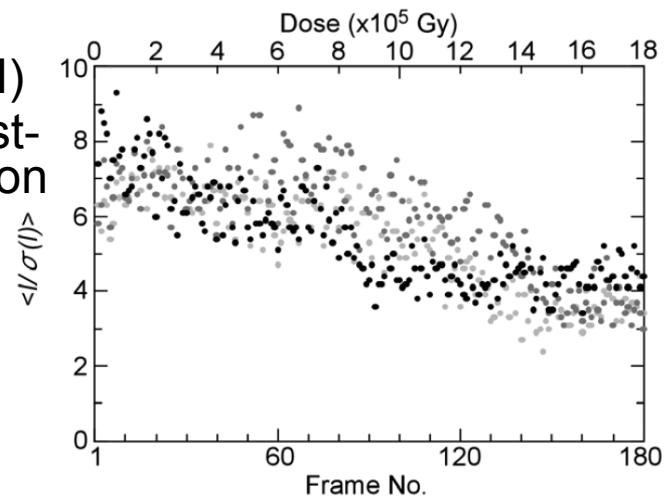

Black: position 3

**b:  $R_{\text{sym}}$   
(highest-resolution shell)**

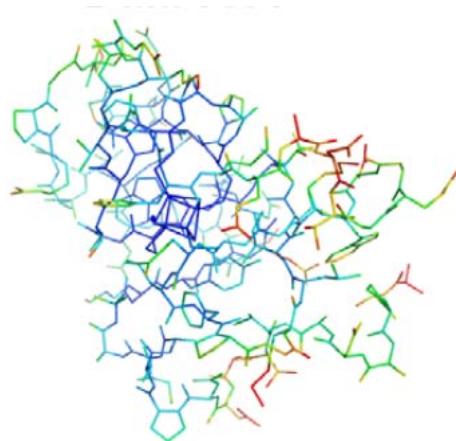

**c:  $I / \sigma(I)$   
(highest-resolution shell)**

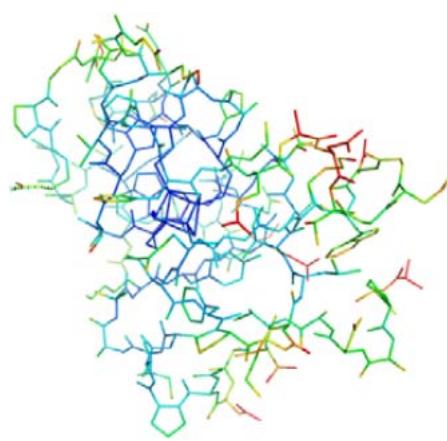

HiPIP at 0.7 Å resolution:  
Changes in temperature factors of protein molecule as exposure to X-rays

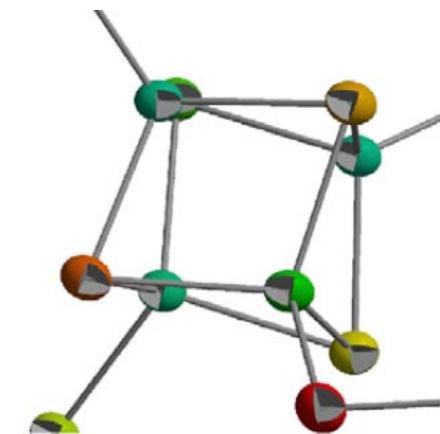

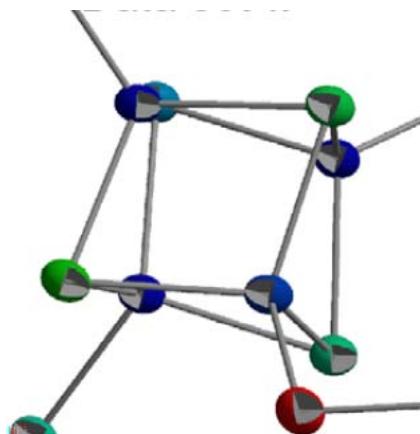

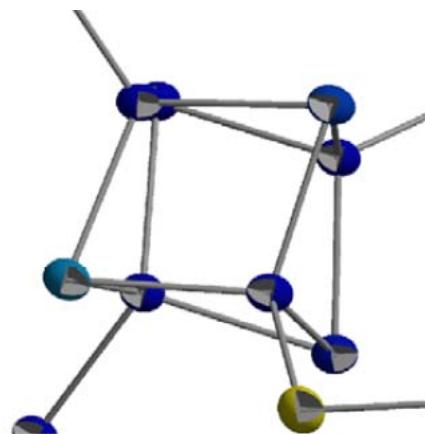

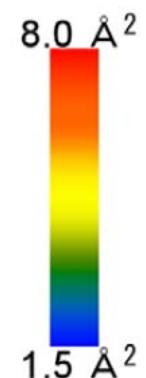

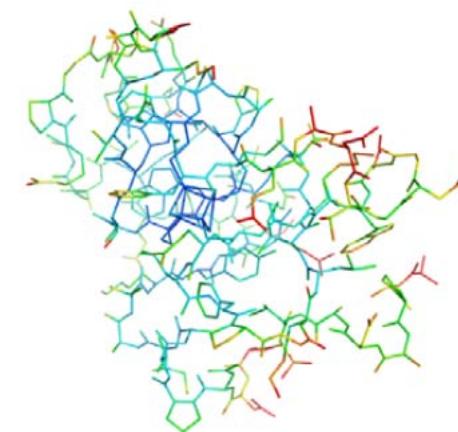

**Dataset I**

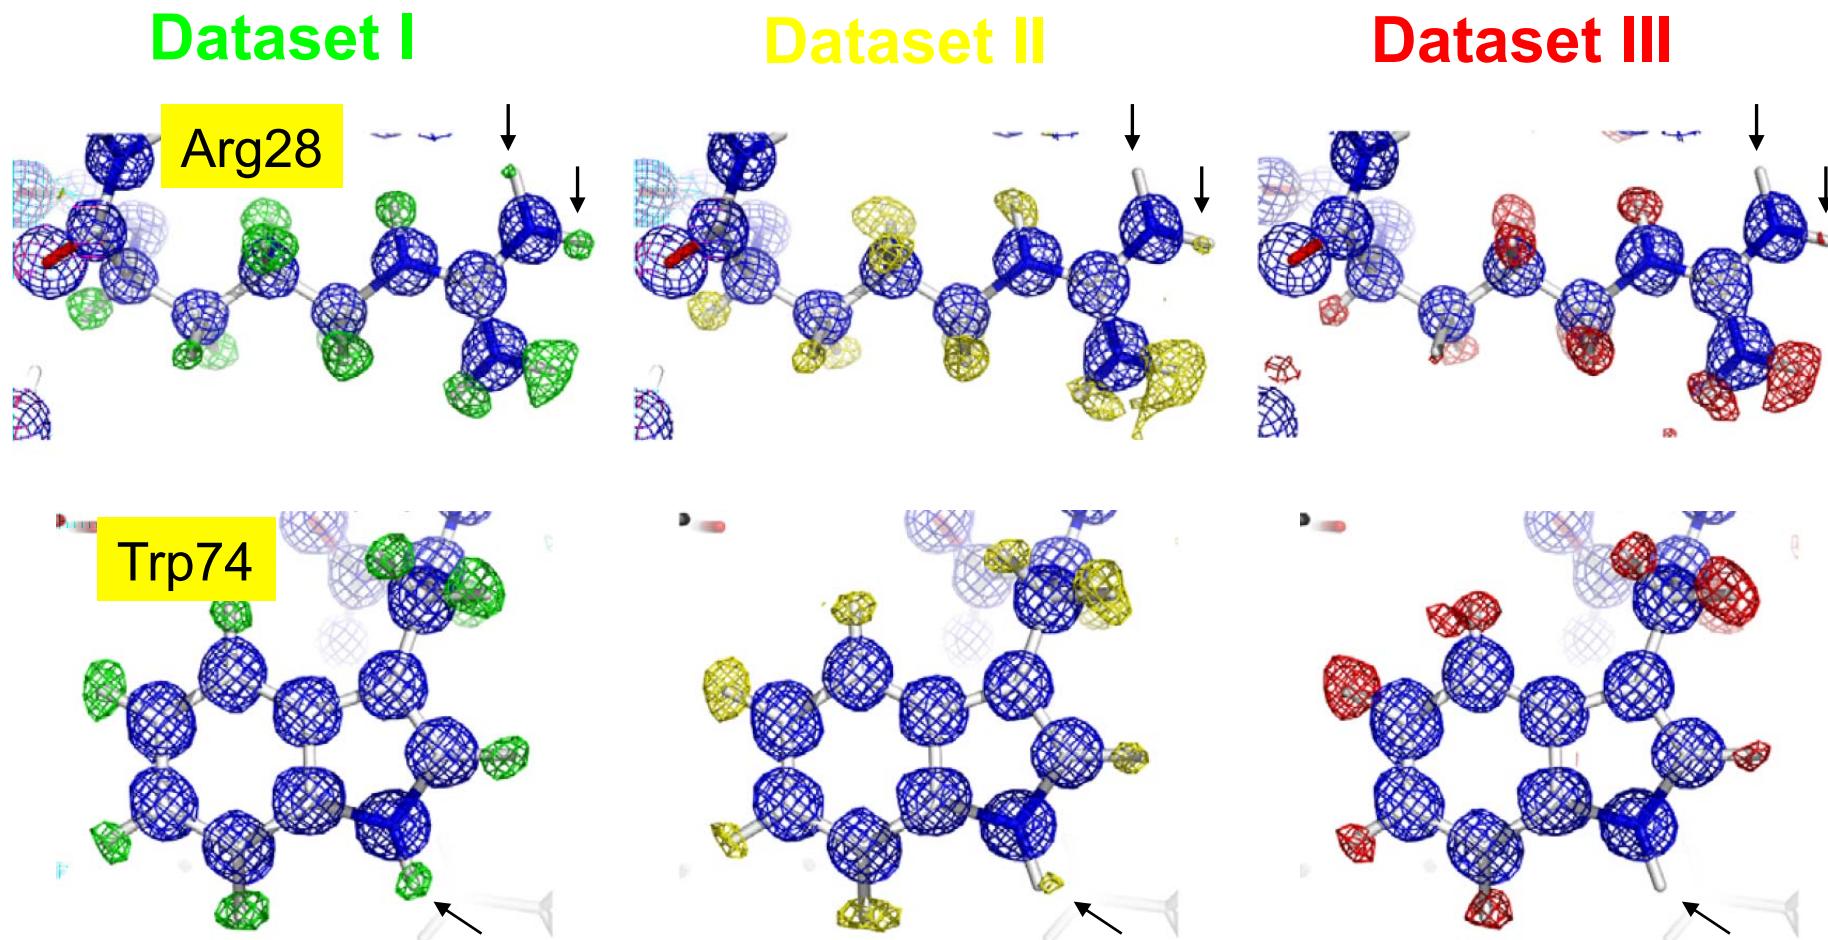

**Dataset II**

**Dataset III**

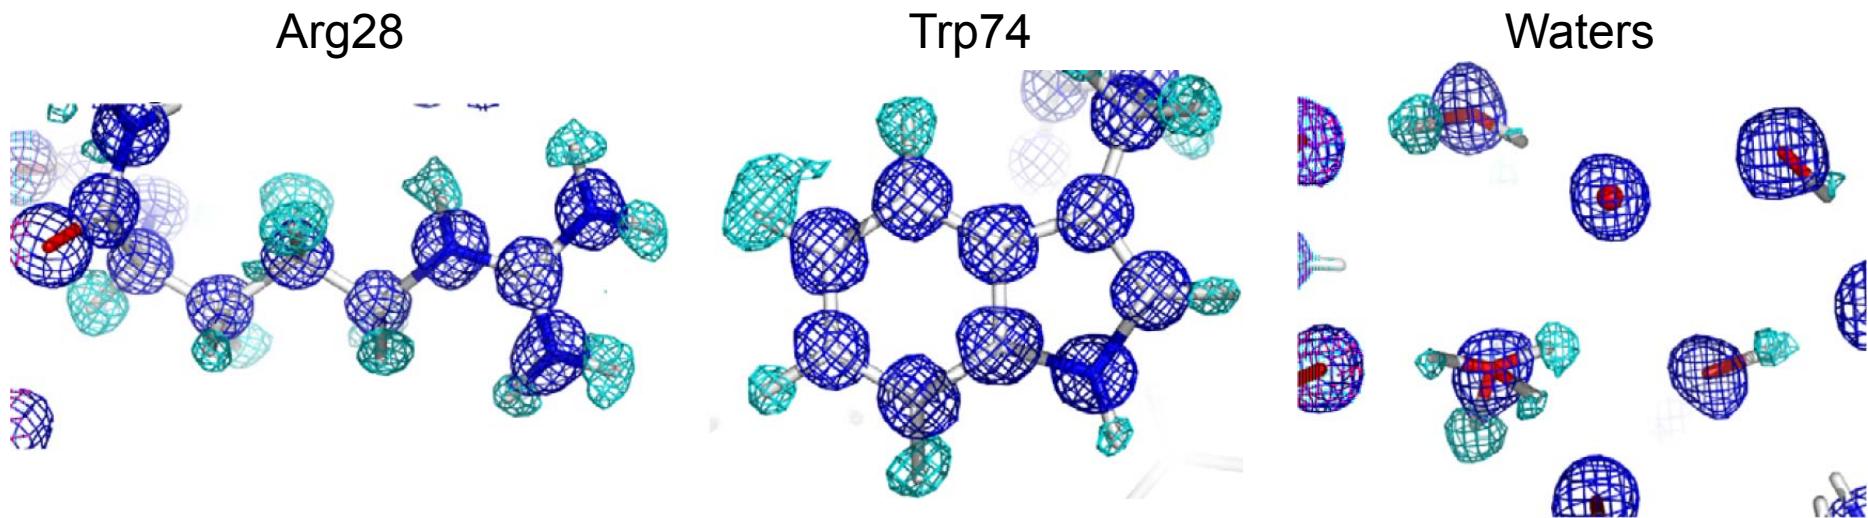

HiPIP at 0.7 Å resolution:  
The loss of electron density of hydrogen atoms  
around Arg28 and Trp74 by exposure to X-rays

Blue: 2Fo-Fc contour  $1.5 \sigma$  ( $1.3 \text{ e}\text{\AA}^{-3}$ )

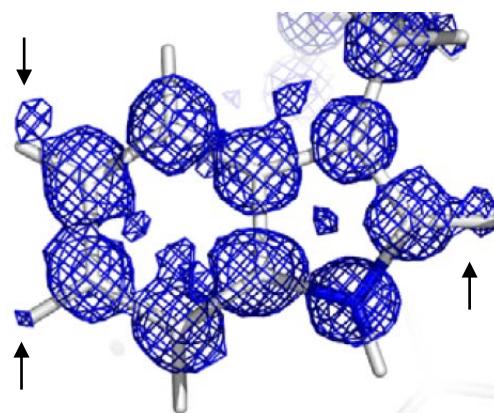

Green, Yellow, Red: Fo-Fc calculated by omitting hydrogen atoms contour  $3.0 \sigma$

# HiPIP at 0.7 Å resolution by “low dose” data set: Electron densities

Blue: 2Fo-Fc contour  $1.5 \sigma$  ( $1.3 \text{ e}\text{\AA}^{-3}$ )

Light blue: Fo-Fc calculated by omitting hydrogen atoms  
contour  $3.0\sigma$  (Arg28, Trp74),  $2.5\sigma$  (Waters)

Trp74

Blue: 2Fo-Fc contour  $0.8 \sigma$  ( $0.7 \text{ e}\text{\AA}^{-3}$ )

## Charge density analysis in protein crystal structure

### Multipolar atom model

$$\rho_{\text{atom}}(r) = \rho_{\text{core}}(r) + P_{\text{val}}\kappa^3 \rho_{\text{val}}(\kappa r) + \sum \kappa'^3 R_{nl}(\kappa' r) \sum P_{lm} Y_{lm}$$

N.K. Hansen & P. Coppens, *Acta Cryst.* **A34**, 909-921 (1978).

$\rho_{\text{atom}}$ : the atomic electron density

原子の電子密度

$\rho_{\text{core}}$ : the spherical core electron density

内殻電子密度

$\rho_{\text{val}}$ : the spherical valence electron density

外殻電子密度

$P_{\text{val}}$ : the valence shell populations

外殻電子の存在確率

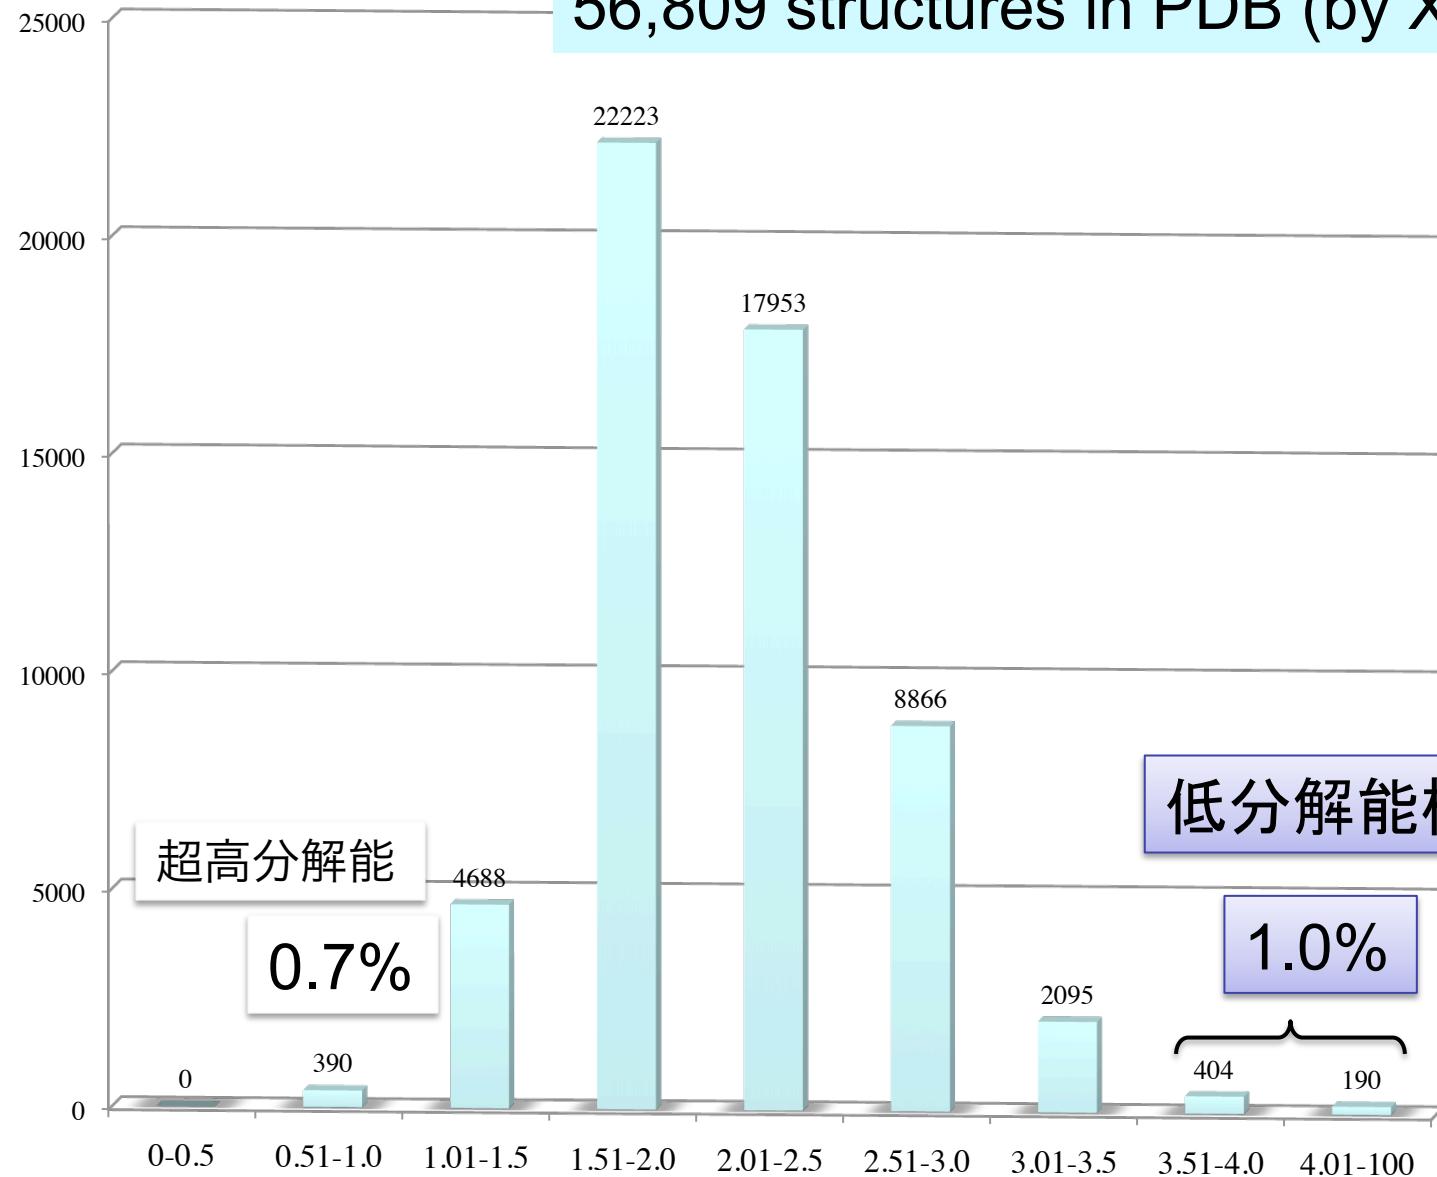

$P_{\text{lm}}$ : the multipole populations

多極子の存在確率

$\kappa, \kappa'$ : expansion-contraction parameter

電子密度の収縮を表す係数

56,809 structures in PDB (by X-ray)

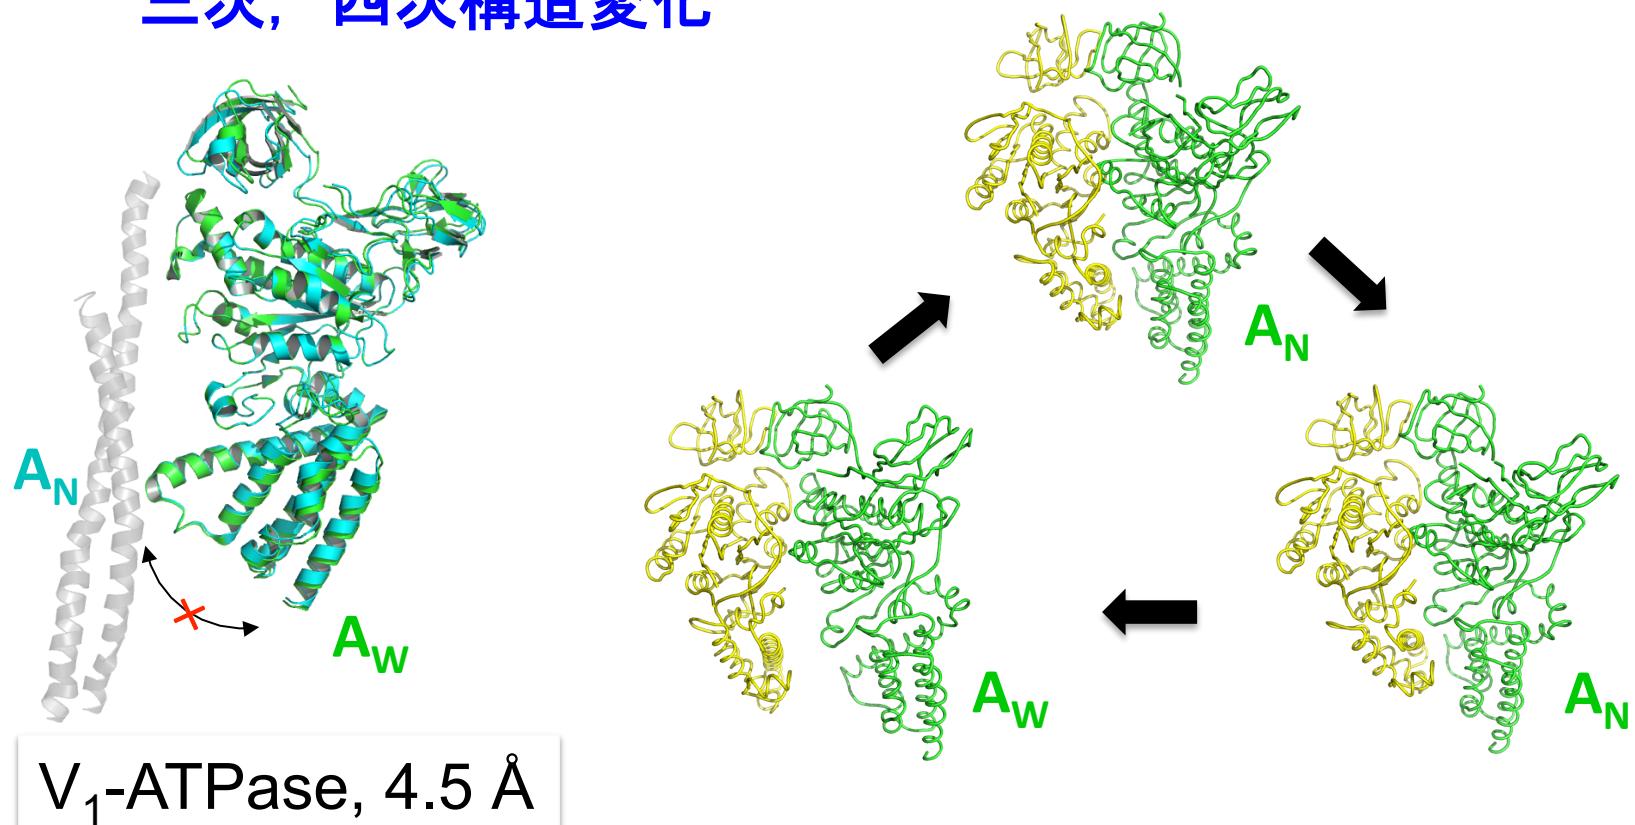

## 低分解能構造解析から得られる重要な構造情報

6 ~ 4 Å

二次構造 ( $\alpha$ -helix)

低分子リガンド（基質、補因子）の結合部位

三次、四次構造変化

Numoto, N. et al., *EMBO Rep.*, 2009.
